Hi all. Was wondering if anyone could recommend an antenna no higher than 5 feet that I would be able to mount in my attic. In case any of this matters:
- I live in NYC Metro area.
- Attic is all wood, typical shingles on roof.
Thanks.

10. Live Scanner Chat Tonight

Newsgroup: rec.radio.scanner
Date: 2001-01-01 02:05:44 UTC
From: - <psleprob@hotmail.com>
Message-ID: <3A4FE5DD.3744705C@hotmail.com>
Source record: 73309
Cross-posted to: alt.radio.scanner,rec.radio.scanner

There will be a live chat going on in the #scanatlanta chatroom on the DALnet servers of IRC tonight starting a little after 9 p.m. EASTERN time. While most of the past participants have been from the Atlanta area, we invite anyone to stop by and chat about our hobby and what you happen to be hearing on your scanner tonight.

The is a pretty laid back chat group and we aim to keep it that way. THIS CHATROOM IS NOT A PLACE TO CONDUCT FLAME WARS, DISCUSS POLITICS, OR CARRY ON ANY OF THE OTHER USELESS CRAP LIKE HAS BEEN SEEN IN THE "USENET" NEWSGROUPS. If you can't be fun and sociable, please stay away.

For those of you who aren't familiar with connecting to chat groups, some info. is posted at the end of this message that should help anyone with a basic knowledge of computers to get started.

Hope you have a chance to drop by!

Use an IRC (internet relay chat) chat program such as mIRC, pIRCh, etc., to access the ScanAtlanta chatroom. You download the mIRC program for FREE at http://www.mirc.com/. There are lots of FAQs covering IRC chat in general on this site. Since that website gives a good overview of IRC, I will not try to duplicate it here. Basically, "IRC chat" is a way to chat "live" with people around the world.

IRC software packages are available for most any computer running Windows 3.1/95/98 and Mac. These programs are not hard to setup and run for most people but everyone's computer is unique and thus could have conflicts of some sort. We have tried the Java based chat software programs, but they were very slow/cumbersome. Since we did not get a good response from new members toward the Java programs, we went back to IRC based chat.

Once you download the mIRC software and install it, follow the setup directions as prompted by the software (put in fake stuff for your real name and email address!!) and pick a nickname for yourself. Then once you are_already_online to your ISP, you click the second icon from the left ("options") on the icon bar found near the top of your screen. A popup window will appear. WE HAVE SWITCHED TO THE "DALNET" SERVERS BECAUSE OF THE HIGHER PARTICIPATION RATE AND APPARENT EASE OF USE FOR SOME VISITORS AS COMPARED TO THE PAST SERVERS. Go to the second drop down box which lists the different servers available, scroll down this list until you get to the section that starts out with "DALnet" server

names, click on one of them (I usually try the one in Ohio or New York, but you can try any_one_in the US). Then click on "connect," NOT the "OK" button. It will take a while to connect and get you going. Click on the "Status" box to watch your computer and the server "do a dance" and connect. This little dance can take a while to complete. Additionally, you may get a "can't connect" or "server full" error which means you must try another server. To do this, you again click on the second icon from the left ("options") on the icon bar near the top of your screen and choose a new server (follow the directions as above).

Once things come up on the screen, click on the "channels" icon (third from the left). Type in #scanatlanta in the top box/entry field, then click on "join" - NOT "OK "or "close" buttons.

If you are successful, you should see a new window open and you will find yourself in the chat room. On the right side, you will find a listing of those who are in this chatroom. Just type in "hi" (and hit return). Somebody should
answer you. NOTE: Often people will go away from their computers for a few minutes to do other things, so stick around for a few minutes if you don't get an answer right away.

The chatroom is open for anybody to use 24 hours a day, 7 days a week, but as of late, about the only time you will find anybody "alive" in there is on Friday or Saturday nights. If anybody actually shows up on these nights, they usually come in around 9-10pm Eastern and most usually leave around midnight (depends on how interesting the airwaves are that night). If nobody seems to be "alive" in the chatroom, post a message to the ScanAtlanta list and invite people to join you in the chatroom.

This chatroom is a place for people to come have fun discussing scanners in general and what they are currently hearing on the airwaves. THIS CHATROOM IS NOT A PLACE TO CONDUCT FLAME WARS, DISCUSS POLITICS, OR CARRY ON ANY OF THE OTHER USELESS CRAP LIKE HAS BEEN SEEN IN THE "USENET" NEWSGROUPS. If you can't be fun and sociable, please stay away.

If you post a "breaking event" message to ScanAlert, monitor the chatroom to hookup with others who might also be monitoring the same event (put a "meet in the chatroom" notice in your post to ScanAlert). If you post a message to ScanAtlanta/Alert for people to join you in the chatroom, remember, it can sometimes take 15 minutes for your emails to get out to people via EGroups.

That is a brief overview. Read the FAQ's on the mIRC website if you have problems connecting. Visit the homepage for ScanAtlanta at http://www.scanatlanta.com

11. Opinons on Uniden Sportcat 150 handheld

Newsgroup: rec.radio.scanner
Date: 2001-01-01 02:33:32 UTC
From: futurus <futurus@uswest.net>

Hi all,

I recently purchased a sc150 for $75(us). It had hardly been used at all (still in box with all included accessories) and the person just wanted to get rid of it. Have any of you had any experience with this scanner? Was it worth the asking price?

This is the first scanner I've owned, and just wanted to get my feet wet before spending too much money. I've only had it a few days but it seems to perform Ok, but since I am new to monitoring it may yet have some design flaws that I am unaware of.

Also, could some of you post your favorite links pertaining to the hobby. I've been searching the net, but most of the sites I've found contain only freq. lists. What I'm really looking for are general tips, hints, etc.

Thanks

If you haven't already, check out www.airnav.com . This gives you frequencies for all US airports, and splits them up by purpose (approach, departure, ground, etc.) Knowing what a frequency is used for may help you understand what they're talking about. If you're close enough to a larger airport to hear the automated information (ATIS) frequency, it will give you information on what runways are being used and other airport information that might help.

You might also see if your local library has any "how to fly" books. Read the sections on navigation and instrument flying, as this will cover a lot of what you will hear on the radio.

Good luck!

Matt Roberds

I have for sale:

40feet of brandnew belden 9913 coaxial cable this is almost the
very best coax for receiving, scanners and receivers. It comes
with 2 large 1" brass 'F' connectors on it, because you can't solder the
foil wrap. I will through in one 'F' connector to PL259male. you will have
to buy the other at radioshack, a couple bucks.

i will ship this to you for 25.00 via US postal
free shipping

thanks
jpotoma@home.com

18. Pro-2004 problem

Newsgroup: rec.radio.scanner
Date: 2001-01-01 03:46:53 UTC
From: asleep@work.com
Message-ID: <3a4ffd08.5016678@news.kadena.attmil.ne.jp>
Source record: 73316

I have a problem with my 2004. After about 30 minutes of scanning
activity, the LCD panel goes blank, and it no longer scans. This
suggests to me that there's a chip that is breaking down from heat.
Has this happened to anyone in newsgroupland? Is there a fix for this?
Any advice is appreciated.

TW,
I hope you are right, but the I-35 corridor has proven so handy for criminals in the past. My point was, even if the reader isn't in the DFW area, they should still be aware and alert to the possibility. I'm a former 911/radio dispatcher myself, and I take the death of another officer very personally. I want them brought down, brought to justice, and put away (for good).

Source record: 73319

The SC-150 is a darn good handheld, as long as you don't need trunking ability. Mine does a good job of pulling in the weak signals, even with the supplied antenna. The only "flaw" is the battery/AC power system. You can't easily change the battery pack when it's dead, or charge the pack outside the radio. And it only has the one power input, unlike the GRE/Radio Shack scanners which have two power jacks, one to charge and one to power. That makes it less handy for use in the house or car, as you risk overcharging the batteries when using external power for extended periods. And yes, $75 is a good price, especially as you got all the goodies with it.

Lemmy

Have you run it off 12 volts to eliminate the internal AC supply as the source of the problem?

To me, the hardest part of scanning aircraft is understanding what they are saying - they talk so fast that it is hard to believe the ATC and pilots can even understand each other. Of course, they live that speech pattern, so it is second nature to them, I am sure.

It is a good handheld, the battery problem is a problem but doesn't make the
radio un useable.
BTW mine had a rubber plug, plugging the chargeing plugin jack. took it out and
it
was the same as the Junkshack model....

Just a suggestion, but if you're interested in a hand-held scanner, you might consider purchasing a used Radio Shack Pro-26, 43 or 60. For around the same price as the cheapest model available to you new, you'd have the VHF aircraft band plus the military 225-400 MHz band too.

That extra frequency coverage would benefit you if you're an airshow enthusiast. I see all three of those models for sale on this newsgroup quite frequently.

You can decode speech inversion if your scanner can switch to SSB mode.
Change the mode of the active frequency to USB or LSB and you can usually
fine tune into the conversation, or whatever is being broadcast using speech
inversion.

Works well on cordless phones, although I wouldn't know from personal
experience... ;)

I've learned a lot about civilian aviation (lingo, navaids, instrument departures, terminal arrivals, ATC, etc) from on-line simulation (Flight Simulator 98 & 2000) the last couple of years. Try www.satco.org . It's a simulated air traffic control site. I think they have ATC tutorial/training pages there. Although it's for on-line simmers, I believe they do things pretty much as the real guys do.

In addition to visiting www.airnav.com for your airport freqs, try and find charts that have the nav aids near your airport. ATC can be referencing the names of these nav aids. Try http://www.clearanceunlimited.com/main.htm (another site geared for the simmer) for various charts. They also have tutorials for understanding the charts and the nav aids. Check out their learning center link. As I recall, the guy who developed this web site is a real ATC controller.

Excellent suggestiion. I prefer the Pro-60. Because many of them can be modified to receive cell frequencies the Pro-43s are often overpriced. The Pro-26s are Uniden made, and suffer from intermod and images. The Pro-60 was the replacement for the Pro-43 and it's never been very popular since it can't be modified for cells, so prices on the used market are quite reasonable, about $100 to $125.

You have a number of options:
1 - String a long wire into an inverted V and you will have all the signal you need, kits are available at Radio Shack
2 - Mount a mobile scanner antenna near the window or maybe you can rig something so it is just outside the window and not really noticeable from the ground.
3 - A small inexpensive TV antenna that will fit in your attic would work great.

4 - How about a scanner antenna that is smaller than 5ft? There are some out there, maybe others will post links to these antenna sites.
Best of luck.
~Steve~

I have a Pro-43 200 channel Realistic Radio Shack scanner for auction on ebay. This scanner has an early datecode. The mod has not been done yet, but it can be done on this datecode.

This is only a 3 day auction, so bid early. Thanks for looking.

Legality of Broadcasting Public Safety Freqs?

I was approached by a friend that is interested in broadcasting a live scanner from his home in Florida, while the technical aspects aren't a problem and can be easily accomplished my concern is the legality of broadcasting communications without expressed permission. Would appreciate if anyone has information regarding the legality of broadcast before beginning this project.

Thank you for sharing the bookmark, I enjoyed the page very much bring back
many fond memories of some of the early scanners it was my privilege to own.
While slightly off-topic for this group I published a similar page to
http://members.tripod.com/craig328 back in 1999, a reprint of January 1977, 73
Magazine "History of Early CB Radio" containing scans of photos and short
descriptions of radios from that issue.

To: rlee@erie.netSent: Friday, December 29, 2000 6:30 PMSubject: QST
I am KD5OM, Jerry Karlovich and I live in Plano, Texas. Unless you have been living in a cave the past couple of weeks you have heard of the seven prison escapees' that kill an Irving police officer Christmas Eve. The TV news reported that they also robbed a Radio Shack store in Houston earlier and made off with several types of hand held walkie talkie radios. That gave me an idea that I shared with the TDCJ (Texas Department of Criminal Justice) via their web site email http://people.txucom.net/tdcj-iad/ I just got off the telephone with Joe Nesmith of the TDCJ and they like my idea and want me to pass this information along to radio amateurs in the area. Many of us including myself own scanners that will do limit searches. I thought if we, the amateur radio community, did some extra listening to our scanners, just maybe we could hear the convicts and assist in their capture. The radios stolen from the Radio Shack store were FRS (Family Radio Service) radios, business band radios, and amateur two meter talkies. The FRS Band channel frequencies are:

Channel Frequency Channel Frequency
1 462.5625 8 467.5625
2 462.5875 9 467.5875
3 462.6125 10 467.6125
4 462.6375 11 467.6375
5 462.6625 12 467.6625
6 462.6875 13 467.6875
7 462.7125 14 467.7125
The business band radios that were stolen come pre program from the factory with the freq. of 154.600 mhz. although can be programmed to operate from 150 to 160 mhz. And we all know the amateur two meter band. If you hear what you might suspect to be the escapees', contact 911, officer Ricky Bort of the Pearland Police Department at 281-485-4361 office or 281-321-2156 pager. The Huntsville command center is operated 24/7 and can be reached at 936-437-6735 Officer Nesmith's pager is 1-800-299-4099 enter the pin number at the prompt of 6156 then enter your telephone number. You can find names and photos of the escapees' at

http://people.txucom.net/tdcj-iad/ Wouldn't it be a good thing for us if we were directly involved in assisting to capture these guys. And of course, common sense tells us DON'T PLAY WALKER RANGER AND TRY TO CAPTURE THESE GUYS YOURSELF!!!!! 73, Jerry Karlovich, KD5OM

Good thread.

I have a Radio Shack Pro-26. I am pretty close to just going ahead and
purchasing a discone antenna for my attic.

Question:

How long of coax can I run between my scanner and an external antenna
and
not lose any freqs range of the scanner? I have heard some say there is
an
equation for length based upon each freq, and others say that length of
coax
doesn't matter.

Thanks in advance,
Bruce

The length of the coax on a receive-only antenna doesn't matter, EXCEPT:
the longer your piece of coax, the more loss. Keep it as short as possible.
The amount of loss is also affected by the type of coax you use. Briefly:
try to avoid runs of RG-58 longer than 20' if at all possible, especially if
you monitor frequencies above 400 MHz. It's better to use RG-8U/9913 type
coax. If you can't use 8U due to the size (1/2 inch dia.), use RG-6U and
try to find the QS (quad shield) variety. The 75 to 50 ohm mismatch won't
really matter. DO NOT use RG-59U!
Remember, the above applies to receive-only antennas.

Well, Mr. Pfft, I once went so far as to send an e-mail to the FCC asking for an interpretation of USC Title 47, Section 605(a). That subsection, in part, states:

"No person not being authorized by the sender shall intercept any radio communication and divulge or publish the existence, contents, substance, purport, effect, or meaning of such intercepted communication to any person. ... This section shall not apply to the receiving, divulging, publishing, or utilizing the contents of any radio communication which is transmitted by any station for the use of the general public, which relates to ships, aircraft, vehicles, or persons in distress, or which is transmitted by an amateur radio operator or by a citizens band radio operator."

I finally got a partial answer, telling me "The attached fact sheet should assist you with your research", and giving a pointer to an FCC fact sheet at http://www.fcc.gov/Bureaus/Common_Carrier/Factsheets/investigation.txt.

The reply I got also stated: "As with your original request this one has been forwarded to the staff of the Wireless Telecommunications Bureau (717-338-2603) for their response." However, I never did hear from that agency.

You can read the above fact sheet, but it really doesn't answer the sort of question you're asking, because, as it says itself, "This Fact Sheet provides general information regarding the interception of radio communications as governed by the
Communications Act. This Fact Sheet should not be used as guidance for deciding whether you can engage in any specific activity."

So I don't know whether you can ever expect to know in advance just how far the Federal Government would be willing to go in prosecuting a violation of USC Title 47, Section 605(a). Personally, I'd say that by rebroadcasting a scanner's reception over the net, a person does indeed "divulge or publish the existence, contents, substance,
purport, effect, or meaning of such intercepted communication to any person". But then you'd have to decide whether broadcasting police and fire calls is okayed by the exemption that allows the "receiving, divulging, publishing, or utilizing the contents of any radio communication which is transmitted by any station for the use of the general public, which relates to ships, aircraft, vehicles, or persons in distress". I've never seen anything that really clarifies this meaning.

For more on all this, you can try visiting the following links I found a while back:

http://nf2g.com/scannist/us_laws.html (really an excellent page, and updated in 2000)

http://www.cbshop.nl/US-scanner-laws.htm (has a year 2000 copyright notice)

http://www.afn.org/~afn09444/scanlaws/index.html

http://www.panix.com/clay/scanning/reference.html (last updated in 1996)

I have 5 I bought from Scanner Unlimited in Cal from Glen via mailorder. Of my 30 or so portable anteenas it is by far the best over all and in specific ranges is never more than one or two down. You can read a review of it at Strongsignals.net and also find a number for Glen in the dealers section. You won't be sorry. Only probem is the flex elbow. I have had two come apart here but with a few small black gun scope screws and a dril and tap you can make them rock solid. Even with the flaw I still love them and after the mod they are solid as a rock. About $30.00 each if I remember right but well worth it. I use it more than any other on handhelds and just use one of my flex handhleds when I plan to throw it around a bit like in my pocket or a car seat.

In article <Dd546.334796$3E6.4765382@news1.alsv1.occa.home.com>,
I have a bank for FRS setup on one of my hand held scanners, I will add the
154.600mhz and I have the 49MHz kiddy walkietalkies in there also.
We live out in the boonies, way off the beaten path and there is no radio
traffic on those freqs around here.
While I will call the police, I suspect if they show up we will have it
settled before the law can get here. I recently purchasd some of the military
surplus seismic detectors and will scatter them around the ranch.
I wish I had bought a battery operated magnetic detector to monitor the only
"road" in, but I balked at getting too paranoid.

79. Frequency Reference Book

Newsgroup: rec.radio.scanner
Date: 2001-01-02 02:06:41 UTC
From: t`u <t_u69@hotmail.com>
Message-ID: <7nn25tges39h9p9tmvpqf63hqvfob7hpum@4ax.com>
Source record: 73177

I use to have a book that listed just about every available frequency there was in my area and the U.S. for that matter. It listed it by State, county, city, business name and frequency. If it was the police department it listed the base frequency and then different frequencies for patrol cars so you can select the car that patrolled your neighborhood. I realize that if I live in Massachusettes, Middlesex County, [which I do] I cannot listen to frequencies in New York on my uniden hand held scanner. However if someone out there knows where this particular book I U-S-E to have can be purchased I'd sure appreciate it. I've done plenty of searching on the net however I don't get the results that this book would give me.

TIA

Check the TIP31 in the corner of the display board and the resistor that
feeds it. Also make sure the display board is well-grounded. For
details...

I am selling my Uniden Bearcat BC895XLT base communications receiver.

It is in excellent condition (both electronically as well as in appearance).
I am the original owner of this radio. Included is all of the original
packaging,
manual, AC adapter and antenna.

Asking price for the radio is $150 prepaid + shipping. References are
available as are a couple
JPG images of the radio if you're interested in purchasing.

Thank you in advance and Happy New Year!

You think we're telling them anything they don't already know? While I doubt criminals on the run bother to read the NGs, maybe they'll think twice about their plans if they realize how many people are actively looking for them. Then again, maybe not.

The control string for the 245XLT is slightly different. It is Nxx at the
end rather than Cxx

You have two main choices here. First would be the POLICE CALL PLUS books that are sold at Radio Shack, among other places. These are broken down into regions of the country. Second would be the Betty Bearcat National Directory, which would be sold by Uniden and/or their Bearcat scanner club. I really don't have much info on this book, I wasn't impressed with the one I saw some years back. There are other books out there, but I haven't used them so I can't vouch for them. I use Police Call myself. For electronic info, Percon also sells a CD-ROM (www.perconcorp.com) which has all the freqs in the U.S. but may not have local usage info that Police Call has.

Let me preface this by saying that I'm no fan of cable. But when the local Telco could not deliver ADSL because I'm too far from the Central Office, I (sigh!) called Cablevision and went with their "Optimum Online" service. Everyone's mileage may vary, but I'm getting consistently better than T1 download speeds. The stories about cable are true - where you live on a crowded leg of the system, you're competing for bandwidth. But the reality is that, even here in the northeast, an awful lot of the territory is suburban-style housing, and the loading's just not that bad.

And although it is true that you do not share your bandwidth on a ADSL line, that is true only until you get to the ADSL equivalent of the cable head end -- the DSLAM. At that point, you can run into the same congestion problem that cable folks sometimes see, because you get combined with everyone else there. Since the ADSL providers have the same temptations to over-subscribe their

"collector" pipes as the cable folks do, there's nothing to prevent ADSL subscribers from seeing the same congestion problems that cable subscribers can see.

There is also Scanner Master which can be purchased by calling 1 800 722 6701 This is the best freq book by far in my opinion. It's about $40-$50 if I remember right. The 2001 Police Call is out at the Rat Shack for $15.

Hello all,
I have always been fascinated with radio scanning and until now I finally have a radio scanner (SC-180B) thanks to my wife as a christmas present. I have been hooked ever since. My question is, can I get better reception or more frequencies applying a longer antenna? If so, will any antenna do, or does it have to be straight from the mfg? I don't recall seeing extra accessories in the antenna categories on the Uniden web site.
I know everyone is thinking I should have gotten a Trunked scanner, but that will be my next puchase in the near future. I am pretty satisfied with this scanner, I am able to listen in on fire, police, and ems freq's, broadcasts and pretty much able to follow the conversation, since I live in a fairly pretty large city.
I look forward to reading this ng often and hope to gain more insight into this new hobby of mine.

might this be some RF generated by the car's ignition system. seems i vaguely remember, from my old CB days, some kind of in-line filter you connect to your radio's antenna connector to filter the ignition interference... but I'm new to scanning... just a thought.

Radio Shack Pro 64 hand held scanner for trade. The Pro 64 has 400 channels, autostore, autosort, 200 search lockouts, and all the bells and whistles. The Pro 64 is in excellent shape and is very sensitive on VHF Hi. Will include a Watson telegainer antenna for the right trade. No manual but one can be downloaded from the Radio Shack web site.
Would like to trade for a hand held trunk tracker or hand held scanner with CTCSS tones. Scanners I would be interested in trading for are BC 235 XLT, Pro 90, Relm HS 200, or Pro 94. Or what do you have for trade?

Thanks,

I agree with John's recommendation. I also suggest getting your hands on set of Instrument charts and approach books. They do not have to be up to date (unless you want to get really anal about this).

Most of the verbiage actually refers to airways, departure and arrival procedures, and runway approach procedures. The reason the air traffic controllers talk so fast is because they are only going to say one of a handful of things, so the pilots pretty much know what's coming.

The charts themselves are reasonably priced (usually under $10 each). If you're cheap, however, you can ask pilots to give you any out of date charts or books they may have. I usually discard or give away mine when they're out of date.

Interesting question! It depends...

IF you use a connection oriented protocol to access and control the scanner, then I don't see how that could be construed as "broadcasting." If on the other hand you pre-configure the scanner to police channels, for example, and you used a form of streaming audio, then I'd have to conclude that this is indeed "broadcasting."

Frankly, I think the black and white notions get seriously muddled when they hit the Internet. You could make a substantial argument either way.

In any case, I think public safety officials ought to post streaming audio in near-real time on the net just so the rest of us can rest easy that they're doing the job we expect. This goes in particular for those operations that are going completely digital.

I say "near-real time" because I recognize that slips happen and sometimes police say things in the clear that they shouldn't. There is no sense repeating information like that. A ten second delay is what I have in mind. Make it like the "bleep" button used by broadcasters and give it to the dispatcher...

Longer does not necessarily equal better.
The simplest and easiest thing for you to do is to go to
your local Radio Shack and buy an outdoor antenna designed
for scanning. Antenna, mast and lead-in wire should be a
hundred bucks or less. Reception will improve dramatically.

You and your buddy (secret agent boy wonder MarkieJ) should read and HEED:
Recent experience has shown a need to begin recruiting new members for
the Radio Newsgroup Police.

Unfortunatley, these positions do not come with salary or benefits.
You will however, have the satisifaction in knowing that your efforts
will keep these groups the intelligent, open and free exchange of
ideas we currently enjoy.

Requirements :

1. Must be able READ English at a 3rd grade level . (Some exceptions
have been made for recruits in the past).

2. Must be able to write at a 3rd grade level . (ditto)

3. Must be pompous.

4. Must have the ability to read someone's post and determine whether
the contents amount to "Whining".

5. Must be able to issue "points" to posters for their threads.

6. Must be able to identify "Trolls", and dispatch same at all costs.

7 Finally you must not practice what you preach.

Your duties will include scanning the groups for triviality, bullshit,
mediocrity, and general poor taste. All based on the standards set by
the Newsgroup Police, of course.

If interested, please submit your application publicly for review.
Acceptance to be decided by the current Newsgroup Police membership,
anonymous as they always are......

Interesting. When he said "broadcasting", I thought he meant by radio, like a low-power FM station for instance. It never occurred to me that he might mean on the web. Wouldn't that be "webcasting" not "broadcasting"?

> Why do you want their frequencies ?

I used to work as a messenger/driver for about a year in one of the branches in central California, -before- I got into scanning. I still work just about a mile from the old office that I used to work at. Nothing ominous in the works, just curious. I can speak from personal experience that the traffic on the weekends makes for some interesting listening (i.e. when the big supervisors aren't there to listen in)..

> Got something planned, lol. . .

If I did, I'd plunk down the couple of hundred bucks that it would take to afford a decent frequency counter and find out for myself..

Since few know what sporting goods store you're refering or where you are
exactly, that doesn't help much.

The best way to protect yourself is to only have Ham or CB type frequencies or
to get permission from each agency to put their audio on the internet. From
what I understand current internet audio feeds obtain written permission from
each agency to allow audio on the internet. In other words cover your a**.

Warning: it better be a very good scanner, in one case a person in GA put
audio on the internet and intermodulation caused him to put cellular audio
on the internet and he was raided by the Secret Service.

Now that you mention it, I may have had "webcasting" on my mind when I
posted my previous message. I can certainly say that re-broadcasting
a police channel is a violation of the law if done without the express
permission of whatever agency is responsible for that channel.

That's merely the old radio secrecy act as amended. I doubt such an
action would have been legal even in the 1930's.

My point was simply that if the scanner were offered in a connection
oriented manner, that I can't seen how it would differ from a remotely
controlled radio receiver. The radio secrecy act would apply to the
listener, but since that person is listening via a connection oriented
protocol, I don't see how it would be different even if others should
happen to overhear the traffic. After all, someone next to you could
be listening the speaker on your scanner...

It's completly legal. No permission needed as long as you are scanning channels
that do not fall under the ECPA.
The webcast is treated as an extension speaker. Just ask the legal counsel at the
The Arizona Republic or the former APB.com

80 Metres 3.500-3.900 MHz
40 Metres 7.000-7.100 MHz
20 Metres 14.000-14.350 MHz
15 Metres 21.000-21.450 MHz
10 Metres 28.000-29.700 MHz
2 Metres 144.000-146.00 MHz
70 cm 430.000-440.000 MHz

Single Side Band SSB is a mode of communication:
Here are several common modes
AM Mostly your Shortwave Broadcasters and local Medium Wave .530-1.7 MHz
Broadcasters.
Lower Side Band used by Hams and other radio stations in the 1.700 MHz to 29.2
MHz range.
UPPER Side Band used by Hams and other radio stations
FM used by hams and other stations like police and fire 29.2 MHz and above
CW This is morse code transmissions used only by hams and still in use
in the former Soviet Union.

You will need a radio capable of receiving these modes and frequencies.
Check out a local Ham Radio or Shortwave radio supplier. The
Radio Society of Great Britain has more information available.

I've bought a few used ones over the years and some were really grimy with nicotine. I used PRO 409 (the green stuff) and the yellow-brown gunk melts right off the case. I would dis-assemble the scanner and give the covers a bath both inside and out, using a small paintbrush or even a rag. Then rinse well in warm water. Maybe some MEK or some sort of circuit board cleaner will take care of the chassis and components.

If you don't already have one, try getting a telescoping antenna from Radio Shack that connects directly from the scanner. They are usually much better than the antennas that come with handheld units, and you can adjust the length for better reception of any one particular frequency range (see the instructions)

Dan,
Here is how to get rid of the smell once and for all. Take apart the 2006 completely making sure to remove the battery and any other power if it has been modified. You must take apart all the major components, don't forget to take the speaker off the cabinet as well. Now here is where I have had people turn white when I cleaned their equipment - get your dishpan and fill it with hot soapy water, take all your parts and dunk them in! (except of course your speaker and other "paper" parts that would be ruined instantly). Let the boards and case sit in there for about 30 minutes then get an old tooth brush and *GENTLY* clean every surface of every part and put it back in when finished. Do not use too much soap - less is better in this case. Also be careful with the plastic windows. When everything is done, rinse them off one by one and place them on a towel. Dry them off as best you can again being *GENTLE*. You must get a can or two of compressed air before doing this to blow out some of the water that will be trapped under resistors, behind lenses, in trim pots, etc., do this only after hand drying first. Now it is time to be patient and let them air dry for 24 - 48 hours before reassembling. After that day or two has passed and you are absolutely 100% confident that there is no water remaining, you can reassemble the radio, power it up and listen to it with no more stench. If you have any other questions, let me know. Otherwise, good luck!

By the way, I have used this method to clean my own equipment and entire computers with nothing ever going wrong. The trick is removing every source of power no matter how small and having all parts completely dry before applying power again.

Make sure and use REGEDIT to make sure you're not infected. I ran
one the first time I got it and nothing happened. W2K seems to be
immune. I checked REGEDIT and searched through it for the virus.

You can only get "infected" if you open the attachment. Also in case no one else has noticed, the message always comes from the same sender, hahaha@sexyfun.net. You can use the Block Senders feature to eliminate all emails from that sender.

When I first got that email, Hotmail didn't know it was a virus.
I downloaded it and tried it. Nothing happened. I deleted it.
No entries in my registry for it. W2K would have asked for my
CD to replace the changed file before continuing. YMMV.

I also don't use Outlook so there's no address book.

Confirming your reputation through acknowledgment, eh Toilet Boy?

More proof of your "grossly criminal reputation" like your failed attempt to scam Novice Amateur Radio Operators by selling them Extra Class Licenses. Your club web site claims this is a fraud. More likely, it's your way of trying to lie your way out of it because your feeble get rich quick scheme failed.

If it's really a fraud, prove it within 48 hours or be found a liar by default.

> limits, mods?

Well, first off, the BC700A doesn't scan like a normal scanner does. It utilizes service scan. You can scan all channels in the public safety, fire/emergency, aeronautical, marine VHF, and NOAA weather frequencies. It all depends on what button you push. It also has a bank named "Private," that consists of nothing but memory channels.

The BC700A has 50 programmable channels. 20 of these channels exist in the "Police" bank, 20 in the "Private" bank, and 10 in the "Fire/Emer" bank. To program each channel, you must use either the service scan or search function. You can use the up/down buttons to get to the frequency you want, then press the "Prog" button. When scanning in the "Private" bank, the scanner only scans the 20 programmable channels in that bank. When scanning in the "Police" or "Fire/Emer" bank, the scanner scans the programmable channels in those banks, plus all the other frequencies allocated to those services.

The BC700A is an excellent mobile scanner since you don't have to keep reprogramming frequencies in when you move from area to area. The service scan mode scans all frequencies for whichever service you select.

Cellular frequencies are blocked. I don't know of any mods, but for those interested, the BC700A picks up images quite well in the 800 MHZ range. I think it's supposed to be double conversion, but the one I have picks up images at twice the IF, at 21.4 above the frequency.

I know they can't be cellular signals because I bought this scanner after the government made it illegal to sell cellular-capable scanners, know what I mean?

I would use as pure as water as I could find. Here, our water is so full of minerals that the deposits would remain on the boards, traces, & components. And I imagine that at least one of the minerals in our water is salt.

Take the plastic parts like the case halves (of course you must also
remove the speaker) and front panel, Keyboard and knobs and place them
in a bowl with water and a couple Efferdent tablets. Let them sit
overnight and them rinse them well. Let them air drive for the day and
put them back together in the evening.

Worked great for me on a couple radios and mics.

Another trick I have used has been the cleaning of gunked up GE Mastr II
and Motorola mics and speakers. Again, I removed the metal parts and put
the plastic parts in a bucket containing a solution of whitewall cleaner
("Bleche-white"). After a few hours I took them out and rinsed them
off, and left them to dry.

I had bought a box of a few dozen of the filthiest speakers I have ever
seen at a hamfest for $5.00. I parted them out, cleaned the cases as
above, replaced the wiring, and reassembled them. I sold them at the
next hamfest for $15.00 each and made over $500.00 profit with about 2
hours work.

I would leave the power transformer out of the bath, too!

I tried the Febreeze, and although it helps, I think Febreeze works better on fabrics where it can be absorbed.

Right...for future reference it's a VBI (Very Bad Idea) to download and launch attachments you get by email. It also sounds like you don't have any anti virus software which would be a VGI (Very Good Idea) to get. Whichever email program you're using you should be able to tailor it to your individual preferences.

I'll second this, with a minor alteration. Do not use compressed air to remove excess water. Instead, HANG the parts on something resembling a clothes line, or just stand the parts (namely the boards) on end with a couple pencils or the like keeping the board off of the table or other surface. This allows the water to fall away from the board. Now be EXTRA patient and give the parts an extra day or so to dry. Using canned air may force moisture into someplace it shouldn't be.

Sounds like a new "urban legend" to me. The Secret Service doesn't have
jurisdiction over such a problem, the FBI does.

ABC News says that more Americans get their news from them than from any other source, but they don't say "all Americans." You must be one of the ones they miss.

News about the manhunt has been on all four broadcast networks, plus CNN, HNN, and MSNBC for several days at least.

Body handling: HTML body converted to readable text

Hi,

Can someone tell me if I am getting close with MDT MOnitoring for Windows:

Where I am located is in Montreal. So the transmission is in french. My problem is that I am not getting the full characters... Any suggestions on how to improve this..... I have a pro 34 portable scanner using a data slicer from pervisell. Using a magnetic mount antenna. The Discriminator output is hooked up to 10 micro farad tantalum capacitor. The settings in the program are at reverse polarity.

Can some one tell me about the purpose of the message address (3 by 12) its a setting in the program?

Any help would be appreciated

Thanks

Mark

176. MDT Monitoring

Newsgroup: rec.radio.scanner
Date: 2001-01-03 04:22:04 UTC
From: mhawra@hotmail.com
Message-ID: <92u9d7$876$1@nnrp1.deja.com>
Source record: 73277
Body handling: HTML body converted to readable text

Hi,

Can someone tell me if I am getting close with MDT MOnitoring for Windows:

Where I am located is in Montreal. So the transmission is in french. My problem is that I am not getting the full characters... Any suggestions on how to improve this..... I have a pro 34 portable scanner using a data slicer from pervisell. Using a magnetic mount antenna. The Discriminator output is hooked up to 10 micro farad tantalum capacitor. The settings in the program are at reverse polarity.

Can some one tell me about the purpose of the message address (3 by 12) its a setting in the program?

Any help would be appreciated

Thanks

Mark

Here is a sample log

�Pp.���...9.�. 639."Avygdor Moise" ."Claudi, Ian" <880108C3.1164>.Dear Mr. Claudi and Mr. �P..c�ere told to use extended V
AN numbers, specifically we were asked t

I have bought Pro-49 scanner which was pretty cheap. can anyone let me kow
if it can be modified to receive higher frequencies?

Thanks.

Introduction to Scanning
by Bob Parnass, AJ9S

[NOTES: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner, and
rec.radio.info. It is also available electronically from
the rec.radio.scanner ftp archive on the official USENET
FAQ library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

This introduction is intended for people new to the
scanning hobby and is oriented to scanning in the USA.
High level overviews of the following topics are presented:

Why Scanning?
Is Scanning Legal?
What Scanner Should I Buy?
What is a CTCSS and DCS Tone Squelch Feature?
How Do I Determine the Proper CTCSS or DCS Code?
Scanner Antennas
Coaxial Cable Feedlines
Where Can I Buy A Scanner?
Modifying Your Scanner
Scanner Repair Shops
Where Can I Obtain Frequency Information?
Do Your Own Frequency Detective Work
How Can I Use Equipment to Uncover New Frequencies?
Scanner Clubs and Mailing Lists

Why Scanning?

Every day and night, scanner hobbyists are entertained by
what they overhear on their radios. Police cars, fire
engines, ambulances, airplanes, armored cars, trains,

taxis, and buses are all equipped with radios and you can listen to them. You can monitor the local sheriff and fire departments to hear about events "as they happen," before the news reporters hear about them. Hostage dramas, bank robberies, car crashes, chemical spills, neighbor and domestic disputes, tornado sightings are all fair game. In a single afternoon, you can hear a high speed police chase, Drug Enforcement agents on a sting operation, and undercover FBI agents as they stakeout a suspect.

How about listening to a team of G-men protect the president while transmitting in the 167 MHz range?

Baby monitor intercoms are actually transmitters and you can hear them between 49.67 and 49.99 MHz.

Stay ahead of road conditions by listening to highway road crews, snow plows, and traffic helicopter pilots. Many midwesterners monitor the state police and and county sheriff to learn of approaching tornados long before warnings are broadcast on TV and commercial radio. Take your scanner to sporting events and listen to race car drivers, football coaches, etc., in the 151, 154, and 468 MHz ranges.

Monitor the everyday hustle and bustle of businesses, from cable TV repair crews tracking down pirate descrambler boxes, to security guards at your nuclear power plant or mall security guards chasing a shoplifter.

Is Scanning Legal?

In the United States, scanning from your home or at work is perfectly legal in most situations. The Electronic Communications Privacy Act of 1986 made it illegal to listen to mobile phones, common carrier paging, and a few other types of communication. Public law 103-414, signed Oct. 25, 1994, amended the law (Title 18 USC, Part I, chapter 119, sections 25110 and 2511) and outlaws listening to cordless phones, too, but many scanners cover these frequencies.

It is illegal for companies to sell or import into the USA recently manufactured scanners which cover or can be easily modified to cover the cellular phone frequencies, but sales by private individuals will still be allowed.

The rules define "readily altered by the user" as "clipping the leads of, or installing, a simple component such as a diode, resistor and/or jumper wire; replacing a plug-in semiconductor chip; or programming a semiconductor chip using special access codes or an external device, such as a personal computer."

Speaking of privacy, federal law also requires you to keep what you hear to yourself and not use the information you hear on your scanner for personal gain.

Be aware that several states have laws pertaining to scanning while in your car. Indiana restricts some portable scanners. A few states have enacted their own laws against listening to cordless phones. You can find out about these restrictions in a paperback book, Listeners Lawbook, compiled by Frank Terranella, Esq. available for $9.95 + shipping from Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902.

What Scanner Should I Buy?

Radio Shack and Uniden (maker of Bearcat, Regency, and Cobra brands) offer a wide choice of scanners. Radio Shack scanners are actually manufactured by both GRE (General Research Electronics) and by Uniden. Personally, I don't recommend Trident nor many of the AOR brand scanners, although the AR8000 and AR3000 have good reputations and the AR5000 works well.

Programmable (synthesized) units have replaced crystal controlled models as they don't require crystals and usually have a keypad that permits you to store frequencies into channels. Programmables are now so cheap it doesn't make sense to buy a crystal unit as your main scanner unless you get it for under $45 or so.

You can get a battery operated hand held scanner, a bigger "base" scanner which is powered from an AC outlet, or a mobile scanner which connects to your auto's electrical system. There are tradeoffs -- base and mobile scanners have larger displays and almost always provide more audio than portables, and some portables are more prone to interference when connected to outdoor antennas than base models. But when severe weather knocks out the power in your home, there's nothing like having a battery operated scanner to monitor the power utility and police frequencies!

Make sure your first scanner has a "search" feature, which allows it to search all the frequencies between two frequency limits of your choosing. Beware of low cost programmables which can't search. Some models, like the early Uniden SportCats and Radio Shack PRO-2046, allow searching between limits, but the limits are factory programmed and cannot be altered.

Get a model which covers the 800 MHz band. Usage of the 800 - 950 MHz band is growing fast and you will miss out on the action unless your scanner covers this band.

If you're not sure whether you'll like scanning, don't want to spend much money, a 50 channel scanner will do. In general, the more channels and banks, the better.

Most of the action takes place on frequencies between 30 and 1000 MHz, so don't be misled by scanner models boasting coverage from 3 to 2000 MHz. There's currently not much to monitor in the 1000 - 2000 MHz range.

If you are interested in receiving short wave, that is, signals in the 3 - 30 MHz range, it's best to get a short wave radio specifically designed for that purpose. Although some scanners receive the short wave band, their performance in that range is often second rate. The $1500 Icom R8500 and $2000 AOR AR5000 models are exceptions.

Deluxe scanners can be controlled and/or downloaded by a personal computer, a feature which appeals to a small but growing number of scanner owners.

Almost all low and mid-priced scanners are prone to receiving images -- receiving the same signal erroneously on two or more frequencies. With a few exceptions, images are unwelcome due to the interference they cause, e.g., hearing aircraft transmissions while the scanner is tuned to the local police frequency. Premium quality scanners use "up conversion" circuitry, a scheme which greatly reduces, but does not eliminate, image reception.

Currently, the more popular scanners include the discontinued Radio Shack PRO-2042 and PRO-2006 base/mobiles, the Uniden/Bearcat BC895XLT, BC245XLT, SC200, and Radio Shack PRO-91 and PRO-94 portables. A number of owners report problems with the Icom R1 portable and the older Uniden/Bearcat 8500XLT base and 2500XLT portable. The Uniden BC9000XLT base and BC3000XLT portable work very well and are my current favorites. The ICOM IC-R2 and Yaesu VR-500 are the two smallest "pocket" scanners which perform. Both are tiny enough to fit comfortably in a shirt pocket so you can monitor without attracting undue attention.

Looking for value? At $170 discount price, the 100 channel Uniden/Bearcat BC278CLT base is a good value and available at most Sears and Best Buy stores. The Uniden Sportcat SC200 portable performs very well is an excellent value at its $220 street price.

CTCSS and DCS Tone Squelch Feature

Upscale scanners can be optioned with a subaudible tone decoding squelch circuit. There are two types: CTCSS (Continuous Tone Coded Squelch System) and DCS (Digital Coded Squelch). In simple terms, this feature lets your

scanner ignore signals you don't want to hear.

Most land mobile two way radios, except trunked systems, transmit either CTCSS or DCS signals subaudibly along with the voice information. U.S. military field radios employ wider deviation and a 150 Hz CTCSS tone, not supported by most scanners or CTCSS decoders.

There are over 40 different CTCSS codes and you can program a specific CTCSS or DCS code into each memory channel. Using a CTCSS or DCS decoder permits your scanner to open the squelch only if the transmission has a code which matches the code you program.

CTCSS and DCS decoding offers several advantages:

1. Ignore unwanted signals on shared frequencies: It is common for several users to share the same frequency, e.g., my county sheriff uses the same frequency as Chicago Police, located about 60 miles away. I want to hear my sheriff's transmissions but don't want the scanner to stop on or listen to Chicago Police transmissions. This is especially a problem when radio propagation is good, e.g., during a "band opening," when reception range is temporarily increased.

2. Combat intermodulation interference: Helps keep out intermod and image interference from strong pagers and other signals which are not transmitted with a matching code.

3. Ignore scrambled transmissions: Many federal law enforcement agencies (FBI, Secret Service, etc) and some local police agencies employ digital voice scrambling, which sounds like white noise and is annoying to hear. The CTCSS or DCS code is sent only when the station is transmitting unscrambled, or "in the clear." You can program federal frequencies along with the proper code into your decoder-equipped scanner so you won't have to listen to the scrambled mess and only hear their transmissions when they are unscrambled.

CTCSS also goes by various tradenames: Motorola's PL (Private Line), GE's Channel Guard, and RCA's Quiet Channel. Motorola uses the tradename DPL (Digital Private Line) for its digital coded squelch.

How Do I Determine the Proper CTCSS or DCS Code?

There are a few ways to determine the CTCSS or DCS code transmitted by a station:

1. Use an outboard CTCSS/DCS reader which must be attached to the discriminator output circuitry inside the scanner. The reader has an LCD or LED display which indicates the code when a station transmits. I use a CSI model CD-1 Communications Decoder Unit, an an excellent reader which sells new for about $200. (Connect Systems Inc., Ventura, CA, 800-545-1349, http://www.connectsystems.com).
2. Many of the ScannerMaster guides, as well as scanner club newsletters, print the CTCSS codes used by transmitting stations.
3. On some scanners equipped with the CTCSS squelch, you can program into memory the frequency of interest. Then you "tune" slowly through all the different CTCSS and/or DCS codes until the squelch opens and you hear the dispatcher talking. This is a slow process and the station has to keep transmitting during it.
4. A slow, brute force method is to program the same frequency but a different CTCSS code into several channels and see where your scanner stops.
5. In some cases, I've actually examined the walkie-talkies I want to monitor and found the CTCSS code printed on a label on or inside the radio.

Scanner Antennas

All scanners come with a built in antenna, permitting reception up to about 20 miles or so.

Portable scanners are supplied with a helical (spring shaped) antenna, covered by rubber. The rubberized antennas furnished with current models are too stiff and place stress on the antenna jack. Older scanners to be supplied with more flexible antennas. I prefer these alternative antennas for use with portable scanners:

1. The Icom FA-1433B dual band flex antenna, a thin and very flexible rubber antenna, is slightly longer than a stock heliflex but provides better performance. The Premier (Prime) RD-9 and RD-9SMA are about the same length but even thinner.
2. The Austin Condor is a 12" long rubberized antenna available for about $30. While considerably longer than the stock antenna and the FA-1443B, the Condor is very flexible and provides VHF-high band reception superior to both. It is not designed to cover the VHF-low band, but will allow reception there at least as good as shorter antennas. The Austin Condor is available from Grove Enterprises.
3. The "Thin-Stick" is an 18 inch telescoping antenna for extended range. It is made in USA by Smiley Antenna Co., Inc. and is designed to cover both the 2 meter

and 220 MHz bands, but its variable length means it can be adjusted for optimum performance on other bands. What makes the Thin-Stick different from an ordinary telescoping antenna is the spring between the antenna and the connector portions. The spring absorbs most of the impact if the antenna collides with an object. The street price is about $17 and it is available from Amateur Electronic Supply, Milwaukee and other retailers.

Outdoor antennas, like the Channel Master 5094A (available from Amateur Electronic Supply) or Antenna Specialists AV-801 (recently discontinued), can extend reliable reception to 50 miles or more, depending on terrain. If you do use an outdoor antenna, be sure to disconnect and ground it during storms and when not in use to avoid a lightning hazard. Discone and ground plane type antennas can be more prone to cause scanner damage due to static charge buildup because they are not at "DC ground."

Coaxial Cable Feedlines

If your antenna installation requires more than 50 feet of feedline, use RG213/U or high quality RG8/U coaxial cable. RG213/U, e.g., Belden type 8267, has a non-contaminating jacket and will last longer. Each has an outer diameter of about 13/32". Similarly sized Belden 9913 cable and clones have lower attenuation but are difficult to bend, require special connectors, and can accumulate moisture inside because they are hollow.

If you must use a small diameter cable for long runs, use RG6/U. Avoid RG58/U (7/32" OD) due to its losses at high frequencies. RG8/X (1/4" OD) is suitable for short patch cords.

Where Can I Buy A Scanner?

Almost every community has at least one Radio Shack store, and you can find scanners there. Be sure it is on sale, as Radio Shack list prices are high and their scanners are offered at reduced prices by mail order discounters.

Discount chain stores like Wal-Mart, Best Buy, K-Mart, Service Merchandise, and Circuit City sell scanners, but carry just a few models. Department stores, like Sears Roebuck and Montgomery Wards, sometimes offer low end scanners, although at high prices.

The best buys on new scanners are from reputable mail order radio dealers, for example:

- Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902. For a free catalog, call (828)837-9200. Telephone (orders only): (800)438-8155. Web page is http://www.grove-ent.com

- National Electronics (formerly National Tower Company), PO Box 15417, Shawnee Mission, KS 66215. Telephone (800)762-5049, (913)888-8864. Web page is http://www.sound.net/~ne/

- The Ham Station, 220 N. Fulton Ave., Evansville, IN 47719-0522. Telephone (800)729-4373, (812)422-0231.

- Scanner World (Albany, NY). Telephone (518)436-9606.

- Amateur Electronics Supply (Milwaukee, WI). Telephone (800)558-0411. Web page is http://www.aesham.com

Beware of inflated "shipping and handling" charges and be sure to include these when comparison shopping.

Used scanners may be found at hamfests, flea markets, garage sales, or listed in the classified advertisement section of your newspaper.

Modifying Your Scanner

The term "mod" is often used as shorthand for "modification." If you are handy with a soldering iron, you may be interested in modifying ("modding") your scanner to add features or enhance its performance. Be warned this usually voids your warranty and current models are difficult to service due to the small, delicate surface mount components. Modifying any scanner to receive cellular phone signals is now considered illegal. By federal regulation, new scanner models must be designed to they cannot be easily modified to tune the cellular phone bands.

The term "mod" has been narrowly used by some people to mean a change which permits a scanner to receive cellular phone frequencies. This definition is far too restrictive as there are several ways one could modify a scanner, e.g., changes to improve audio quality, adding an S-meter, expanding the number of channels, changing the earphone jack to accept stereo headphones, etc.

Modification article files can be copied from several ftp sites including the /pub/hamradio/mods directory at:

garfield.catt.ncsu.edu
oak.oakland.edu (IP address 141.210.10.117)

Modification articles posted on Usenet seem to have a life of their own. Frequently, they are plagiarized from the

Internet and compiled by book, CDROM, and magazine publishers, sometimes reworded, then sold. Hobbyists then copy the modifications from the books, CDROMs, and magazines back onto the Internet or BBSs (bulletin board systems)!

Grove Enterprises and other companies advertise a warranted, modification for fee service.

Scanner Repair Shops

Is your scanner broken? Aside from sending the scanner back to the manufacturer for repair, here is one company which repairs scanners:

- G & G Communications (telephone 716-768-8151) - (http://www.iinc.com/ggcomm or email ggcomm@iinc.com or ggcomm@aol.com) This family owned company repairs scanners and pagers and stocks parts for several older models. G & G cannot usually repair AOR scanners due to lack of manufacturer support. G & G sells and sometimes buys old scanners and parts, too. They are located at 7825 Black Street Rd., LeRoy, NY 14482.

Repair tips for Bearcat and Radio Shack scanners are discussed in two other FAQ articles.

Where Can I Obtain Frequency Information?

To avoid chaos, the FCC licenses two-way radio users and assigns them specific frequencies. Groups of frequencies are allocated to specific types of users, so you won't usually find fire departments using the same frequencies as taxi drivers, for example.

Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books: The most convenient source of fire, police, and local government frequencies is Gene Hughes' Police Call Plus, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores. The newest editions contain abbreviated business listings, too, although callsigns and other details are listed only for local government and public safety licensees.

I also recommend the book, Monitor America, published by SMB Publishing (now known as Scanner Master Publishing), and available from Grove Enterprises for about $30. A 1100 page 3rd edition is now available. Monitor America contains several pages of police, fire, local government, news media, sports, federal government, and commercial

broadcast frequencies for all 50 states. It contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Uniden has published several regional directories using the "Betty Bearcat" name, although there are much better directories available from Scanner Master (Newton Highlands, MA, tel. (508)655-6300) for some regions.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Commercial Magazines: Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times (tel. 828-837-9200, http://www.grove-ent.com) and the sensationalistic Popular Communications, (tel. 516-681-2922). National Scanning (NatScan) is a national scanner magazine published bimonthly and is affiliated with Uniden's Bearcat Radio Club. The best scanner frequency lists are often found in club publications, not commercial magazines, and are discussed later.

Government Records: Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS). The high cost of buying government records limits their appeal to hardcore enthusiasts. You can write for a catalog of FCC Master Frequency Database items to the NTIS, 5285 Port Royal Road, Springfield, VA 22161.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the

public on CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM. The PerCon Spectrum CDROM sells for under $29 and contains a handful of fields for every FCC license in the US. The Spring 1995 edition works in DOS, Windows, and Mac environments.

Grove enterprises sells FCC license information on CDROM, too.

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country since 1994, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a beautiful 11" by 17" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc. See http://www.megsinet.com/~parnass for a sample.

RadioMap has been advertised monthly in Monitoring Times magazine since 1995. The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)

dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $10.00, the deluxe report includes an extra index sorted by frequency and a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $39.95 for deluxe RadioMap report with histogram and additional index by frequency. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

Do Your Own Frequency Detective Work

When you try listening to a frequency for the first time, you'll want to know who you're hearing.

Although FCC rules require radio systems to identify their operations with their assigned call letters either automatically or verbally, most ignore the regulation. This often makes it difficult to know who is transmitting. Moreover, many radios are now being placed in service illegally, without first obtaining the required FCC license.

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and try to determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an

invitation.

Most listeners use a combination of both approaches.

You can examine the FCC license on premise. I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the mall security office or company guard shack. You can examine the labels on radio equipment. Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret. Hobbyists are urged to exercise a modicum of restraint and good judgement, however.

How Can I Use Equipment
to Uncover New Frequencies?

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. A few models, like the ICOM R7000/R7100, and R1, and older Bearcat 250 and Regency K500, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy, a Radio Shack CTR-82 will do. It's best to use a shielded, attenuating cable to feed the scanner audio into the recorder rather than relying on the recorder's internal microphone.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at

the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

Are There Any Scanner Clubs or Mailing List?

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than any pile of magazines.

Clay Irving <clay@panix.com> administers a scanner electronic mailing list, called "scanning." To subscribe, send an Email message to: majordomo@lists.panix.com

In the body of the Email message, put: subscribe scanning

Other scanner mailing lists include: scanner@onelist.com, scan-l@onelist.com, scanner@qth.net, and sonofrcma@onelist.com.

All Ohio Scanner Club

A smaller club is the All Ohio Scanner Club. Its bimonthly publication, The American Scannergram, is about 60 pages long. Although concentrating on Ohio and the Northeastern states, there is frequency information from other states, and plenty of good product reviews and scanning tips.

Annual dues are $18.50 and more information is available from:

Dave Marshall, Managing Editor
All Ohio Scanner Club,
50 Villa Road,
Springfield, OH 45503.

Chicago Area Radio Monitoring Association

The Chicago Area Radio Monitoring Association (CARMA) is the foremost club for scanner radio hobbyists in the northern Illinois area. CARMA was formed from the Chicago chapter of the Radio Communications Monitoring Association (RCMA), and we have been meeting since the early 1980s.

Many CARMA members are active in ham radio and GMRS, but the club is devoted to scanning and scanners.

Meetings are held on Saturdays, many at area restaurants, about 6 times a year. Although lunch starts at noon, the meetings begin officially at 1 PM and often run until about

4 PM. You must purchase a lunch since we get the room for

- 2 -

free. Meetings consist of a quick review of club business, sometimes a special presentation, and a "round table" discussion/question & answer session. Large quantities of information and frequency lists are often distributed in the form of free handouts. Members often sell radio equipment at the meetings, too.

In addition to regular meetings, there are two CARMA picnic/field days during which members meet at a park, erect antennas, eat, and operate scanners from battery power. CARMA members take organized tours of various communications facilities in the area.

Club meeting dates and times are published on the CARMA email list, carma@qth.net. You can obtain a free electronic subscription to the CARMA email list. For more info, see:

http://www.qth.net

The club's mailing address is:

CARMA
P.O. Box 2681
Glenview, IL 60025

Most meetings are be held on Saturdays at Phillies Pizza, 6300S. Kingery Highway, located in the shopping center at the corner Rt. 83 and 53rd St. in Willowbrook, IL.

HOW DO YOU FIND THESE SCANNER FREQUENCIES?

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner, and
rec.radio.info. It is also available electronically from
the rec.radio.scanner ftp archive on the official USENET
FAQ library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner. The author writes a monthly
"Scanner Equipment" column for Monitoring Times magazine,
published by Grove Enterprises, but views expressed in this
article are his own.]

I am often asked, "How do you find these frequencies?"
This article answers the question in various sections:

Books
Magazines
Government Records
Web Sites
Federal Radio Stations
Radio Clubs
Do Your Own Sleuthing
What Makes Station Identification Difficult?
Examine the FCC License on Premise
Examine the Labels on Radio Equipment
Examine the Antenna to Determine Frequency Band
Equipment to Determine Frequency Usage
How Can I Determine To Whom I'm Listening? - An Example
Summary
Addresses

Books

The most convenient source of fire and police frequencies
is the Police Call Plus, published each year in 9 regional
volumes by Hollins Radio Data, and sold at Radio Shack and

larger book stores for under $13. Police Call Plus is basically a computer printout of FCC license information in the fire, police, local government, and conservation services in two lists: by licensee name within state, and by frequency. A few pages of local airport and nonsensitive federal government frequencies are included. Selected business frequencies are listed, too, but without callsigns and other details.

I highly recommend Richard Barnett's book, Monitor America, published by Scanner Master Corp. A 3rd edition is available from Grove Enterprises for about $30. It is crammed full of police, fire, local government, news media, sports, national park, and commercial broadcast frequencies for all 50 states. The information was compiled mainly from members of the Radio Communications Monitoring Association (RCMA), now defunt. Monitor America contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call Plus, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Scanner Master also publishes regional frequency guides for Illinois, Florida, Virginia, Massachusetts, New Jersey, and other states.

Aeronautical frequencies are covered in the Aeronautical Frequency Directory, written by Bob Coburn, W1JJO. Although most of the information is about civilian aviation, Bob included sections on military mid-air refueling and CAP. The 401 page third edition is available from Official Scanner Guides (P.O. Box 525-NS, Londonderry, NH 03053). The same publisher sells the Maritime Frequency Directory and frequency guides for several New England states. Some of these books are available through Radio Shack, too.

The longstanding source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range. Since the US government no longer offers frequency information for its own stations, and has never published sensitive frequencies, most of the information in Kneitel's book has been collected from listeners over the years. It

is certainly not complete, nor 100% accurate, but is a good book for this difficult to obtain information.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Magazines

Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times and the sensationalistic Popular Communications magazines.

Government Records

Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS).

These lists contain license information for the industrial (e.g. Illinois Armored Car, Pinkerton's Security, Joe's Towing, etc.), highway maintenance, commercial broadcast, aviation, common carrier, and maritime services, as well as for police and fire. For more info call NTIS at 703-487-4630.

Back in "the good old days," Grove Enterprises sold copies of some FCC microfiche files, and this was much cheaper than buying directly from NTIS. Grove no longer sells microfiche, but sells information on CDROM instead.

You can query FCC databases directly from this web page: http://www.fcc.gov/searchtools.html

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on both floppy disks and CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100.

The PerCon Spectrum CDROM sells for under $30 and contains a handful of fields for every FCC license in the US. However, Public Safety license information contained in the Winter 1996 Spectrum doesn't appear as up to date as in the 1997 Police Call Plus.

Spectrum works in DOS, Windows, and Mac environments. One can try restricted sample searches of the Spectrum CD for free via PerCon's web page at http://www.perconcorp.com/db_srch.htm .

Companies have appeared which are "plugged into" the FCC licensing system and they sell computer time allowing on-line file access. They also sell paper copies of FCC information. Washington Radio Reports is one example. A monthly publication, it lists license applications made to the FCC. A few members of my scanner club subscribe and share the information with me.

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country since 1994, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a beautiful 11" by 17" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc. See http://www.megsinet.com/~parnass for a sample.

RadioMap has been advertised monthly in Monitoring Times magazine since 1995. The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $10.00, the deluxe report includes and extra index sorted by frequency and a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $39.95 for deluxe RadioMap report with histogram and additional index by frequency. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

Web Sites

If you have access to the World Wide Web, you can visit dozens of sites with local frequency lists. You can look up civilian aero frequencies for specific airports at: http://www.airnav.com/airports/.

Other frequency web sites include:
http://w5gb.nmsu.edu/kc5kto/,
http://www.fordyce.org/scanning/, and
http://www.scannerway.8m.com.

Federal Radio Stations - Not Licensed by FCC

Since federal government radio stations are not licensed by the FCC, they are not listed in FCC microfiche. In 1981, a group of 60 radio hobbyists split a $1300 fee, and obtained 80 microfiche cards of 'sanitized' information about federal government radio stations under the Freedom of Information Act (FOIA). (See "The Government Giveth, the Government Taketh Away", by Richard Prelinger, in Monitoring Times, July 1982.)

Only 12 of the 21 information fields for each station were furnished. Fields like "Remarks", which indicate the exact usage of a channel (e.g. "Sky Marshall's Net"), and "Bureau", indicating agency subdivision (e.g. TAC within the USAF), were withheld. These 80 pages of microfiche were sold by Grove Enterprises for $25, but are no longer available from that source. Private entrepreneurs have been known to ask $125 or more for a set! In a step backward, the US Government insists it will no longer release this type of information - it is now 'classified'.

(See "AFIO and the FOIA", by Bob Grove, in Monitoring Times, September 1982.)

For a reason unknown to this author, the government released a 1984 vintage set of frequencies allocated to the FAA. Perhaps this was a mistake, because the information is marked 'unclassified', but all fields are furnished, including some which indicate security related usage. Grove sold this set of 33 microfiche cards for about $13.

Two way radio equipment formerly used by the armed forces often appears for sale at hamfests. Less often, Secret Service and FBI radios appear there from time to time, too. When you see such equipment, look over the radio for a frequency label and write down the frequencies stamped on the crystals or channel elements. Make note of any service or property tags which specify the agency or military base which used the equipment.

Radio Clubs

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than a pile of magazines.

Since the early 1960s, I had been an amateur radio operator, and belonged to amateur radio clubs, but I never realized there were any scanner clubs! In 1983, I joined the world's largest scanner club, the Radio Communications Monitoring Association (RCMA), now out of business. There are several regional scanner clubs, spun off from the former RCMA, which hold regular meetings.

Another club which prints sensitive federal frequencies is the All Ohio Scanner Club. I enjoy its bimonthly publication, The American Scannergram, which is about 60 pages long. Although concentrating on Ohio, there is frequency information from other states, and plenty of product reviews and scanning tips.

More information is available on the WWW page http://aosc.rpmdp.com and from:

All Ohio Scanner Club
50 Villa Road
Springfield, OH 45503

Do Your Own Sleuthing

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of

information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

What Makes Station Identification Difficult?

In most instances, FCC rules require radio users to identify their operations with FCC assigned call letters. Police and fire departments, especially those with trained radio dispatchers, seem particularly conscientious about station identification. Like commercial broadcasters, many of these stations identify on the hour and the half hour.

Some repeater stations have Morse code identification circuits which transmit call letters on a periodic basis, insuring compliance with FCC rules.

On the other hand, over 75% the industrial radio stations monitored within the last year ignore the FCC regulation, making it difficult for a listener to identify a station. Some stations may operate for years using the nondescriptive "base to mobile 2" or "Joe to base" protocol. One rung up the hierarchy are stations that identify using something like "Acme base to 107", giving the listener a clue for his log. If call letters are given, they are often rendered unintelligible by operators who fail to enunciate. The failure to identify is more likely due to sloppiness, rather than any attempt to hide station identity.

While not regulated by the FCC, federal government radio stations vary in the extent to which they identify their transmissions. Some federal stations do not have call letters. A nearby paging transmitter periodically transmits a voice recording announcing, "This is the Army

Joliet Ammunition Plant." What more could a listener ask for?

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy. I use two modified Radio Shack CTR-75 recorders, a discontinued model.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

If you don't have a VOX recorder, consider a device like the NiteLogger II tape recorder controller, made by Benjamin Michael Industries. It connects simply between scanner and recorder and contains sound activation circuitry to trigger the recorder.

The following examples illustrate techniques I've used to derive new frequency information.

Examine the FCC License on Premise

I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the Bell Labs security office and the guard shack at Waste Management's Greene Valley Landfill in Naperville.

Examine the Labels on Radio Equipment

Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find Dymo or P-Touch tape labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret.

- At the annual Glenview Naval Air Station open house, I examined a military manpack radio being used by dispensary paramedics. The radio's tuning dial was set at 34.15 MHz.

- The Illinois Army National Guard displayed two armored personnel carriers at the local county fair, each

equipped with VHF-FM and HF-SSB transceivers.

In addition to a tuning control (VFO), the VHF-FM radio had a set of channel select pushbuttons, much like those in a car radio. I asked a guardsman a few questions about the radio, and he demonstrated the channel preset feature. A panel above the channel pushbuttons was labeled with the frequencies: 32.055, 34.45, 35.35, 40.55, and 40.60 MHz.

- An Army National Guard UH1 helicopter was displayed at the Marseilles armory "open house". The public was permitted to climb aboard, and observe the instrumentation and radio gear. A channel plate on the instrument cluster listed over a dozen frequencies.

Hobbyists are urged to exercise a modicum of restraint and good judgement. In New Jersey, a radio technician/hobbyist called to service a transmitter in a county building, noticed a new unattended repeater installation in the same room. Being curious about what frequency this repeater was on, he opened the access door to copy the frequencies from the radio's crystals. It turns out that this radio belonged to the US Secret Service, and opening the access door could have activated a "tamper alarm"!

The tech was skating on thin ice. He had nobody's permission to tamper with that equipment.

Another source of frequency information is as close as your nearest Radio Shack store. Some Radio Shack stores make a local frequency list available to assist their scanner customers. Be sure to ask. Stores located in shopping malls almost always know the mall security frequencies. I often check the frequencies programmed into the floor model scanners, too.

Examine the Antenna to Determine Frequency Band

You can often determine a transmitter's frequency band by the size and type of antenna used.

The Police Call Plus book contains sketches of antennas. Antenna catalogs are crammed full with antenna pictures and specifications and they are usually free. Contact Antenna Specialists (216-349-8400), Cushcraft (603-627-7877), Tessco (800-472-7373), Maxrad, Larsen Electronics (800-426-1656), and other companies in the land mobile equipment business.

Equipment to Determine Frequency Usage

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. Some models, including the Radio Shack PRO-2035, ICOM R7000/R7100, Bearcat 2500XLT, and Bearcat 250, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, another spectrum analyzer connected to a receiver IF stage, and a frequency counter for close-in work.

How Can I Determine To Whom I'm Listening? - An Example

While scanning the industrial frequencies in the 150 MHz range, a van driver was overheard communicating with "base" while driving around my town. The stations involved never used FCC call signs -- this would have made life a lot easier for me, and legal for them! (one may use FCC license microfiche, described earlier, to identify stations using call letters.) Transmissions were short and infrequent, so it was decided to tape record all transmissions on this frequency for several days to determine the station's identity.

During daylight hours, a modified Regency K500 scanner was left tuned to the target frequency, connected to a cheap tape recorder through a home built interface. Using a carrier operated relay, the tape interface supplied power to the recorder only during radio transmissions, so a day's worth of traffic could be compressed into a 45 minute tape.

Each day, the tape was played back and notes on names, locations, and activities mentioned during the day's transmissions were taken. The van driver appeared to be making daily stops at a local bank and two shopping malls. A Walgreen's store seemed to be the only stop at one mall. A few times, "base" ordered the van "back to the Training Center." There were frequent references to "guests checking out", "dropping a guest off", and "instructor[s] missing a class". At times, "base" spoke with "security", who must have been using a walkie-talkie as his signals

weren't strong enough to hear.

Was this a hotel? Calls to the three local hotels revealed that none provides shuttle bus service to the shopping malls. A call to the Walgreen's, inquiring about bus service to the store, drew another blank. During my shopping trips, I began to pay closer attention to vans with antennas driving through the parking lots.

I was leaving the mall one day, when a week's effort paid off. A maroon and white van, equipped with a VHF-Hi antenna, was dropping shoppers off at Walgreen's. A sign on the van's door read:

XYZ Central Training Center (XYZ is a pseudonym for the actual licensee name.)
Lisle, Illinois

I watched the driver pick up a microphone, and listened to him on my portable scanner checking back with his "base".

All the pieces fit: the "guests", the "classes", the "instructors". Mystery solved; I had been monitoring the customer training center for a large computer manufacturer. The training center has hotel rooms and dining facilities to accommodate students from out of state. As a convenience, shuttle van service is provided to local shopping malls.

Summary

Through books, government records, and radio clubs, scanner listeners can make use of frequency information compiled by others. Two-way radio users often fail to identify their transmissions properly, making it more difficult for listeners to know who they are monitoring. By examining radio equipment labeling, and monitoring and taping transmissions, scanner enthusiasts can unearth new information.

BUYING A USED SCANNER RADIO

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET groups
rec.radio.scanner, alt.radio.scanner, and rec.radio.info.
It is also available electronically from the
rec.radio.scanner ftp archive on the official USENET FAQ
library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

Abstract

This article discusses the purchase of used scanner radios
and includes these topics:

1. Motivation for buying a used scanner
2. A used scanner may be a broken scanner - where to get
it fixed
3. Evolution of the scanner
4. Obtaining crystals
5. Keyboard programmable scanners

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

Introduction

Anybody with enough money can buy a brand new scanner, but
you can save lots of money if you get a good deal on a used
scanner. Hamfests are probably the best place to find used
radios, but you must be familiar with the equipment.
Hamfests are repleat with older radios you won't see in
today's catalogs.

At last count, there were over 140 scanners and monitor
receivers of various brands in my collection. I purchase
most of my receivers at hamfests or horsetrade with other

radio hobbyists.

Uniden sells refurbished scanners dn you can check current inventory at their web site:
http://www.uniden.com/docs/store

A Used Scanner May be a Broken Scanner

Getting a bargain is not without some risk. I have had sellers look me square in the eye and tell me their radio worked fine -- when it really didn't.

Buying a used portable scanner is riskier than buying a mobile or base model. Portable scanners are subject to more physical abuse and many have been dropped. If a radio has been dropped, the laws of probability dictate that the first point of impact was probably a corner, so be sure to examine each corner for evidence of trauma.

Scanners used in mobile service are subject to vibration, dust, and temperature extremes. This shouldn't dissuade you from buying a used mobile scanner, but be aware of possible complications.

You should have some recourse if the radio you buy turns out to be defective. For hints on fixing older Bearcat base scanners, see "Tips for Fixing Bearcat Scanners," by Bob Parnass, AJ9S, in March 1996 Monitoring Times magazine.

If you can't fix the radio yourself, you can pay to have the manufacturer or a service clinic repair it for you. Radio Shack repairs scanners, and Uniden can repair newer Bearcat models but often refuses to service older models, claiming they are "unrepairable" and carving the letter "U" on the cabinet.

G & G Communications (telephone 716-768-8151) is a family owned company which repairs scanners and stocks parts and crystals for several older models. They usually don't repair AOR scanners due to lack of manufacturer support. They are located at 7825 Black Street Rd., LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

The re-incorporated Electra Corporation, (317)326-4419, is able to effect repairs on some older (pre-Uniden) Bearcat scanners. They sell crystals, antennas, power cords, owner's manuals ($11 ea). Electra Corporation is located at 251 N. 300 W. Greenfield, IN 46140-8496.

You may be able to obtain manuals for older Midland scanners from:

Midland Consumer Radio Products
1670, North Topping,
Kansas City,
MO: 64120
Phone: 816-241-8500

Evolution of the Scanner

It helps to understand some scanner history before shopping for a used scanner. You will likely see radios from many vintages at a hamfest, and should avoid buying early units unless you are a scanner collector.

One of the earliest ancestors to the scanner was the converter. Manufactured by Tompkins (Tuneaverter), Petersen, Bearcat (Lil Tiger), Midland, and others, converters were made to operate in conjunction with AM radios. Then came wide band monitor receivers, in both tunable and crystal control models, like the Radio Shack PRO-2B. Truthfully, converters and tuneable FM receivers are interesting but don't work well by today's standards.

While tuneable receivers were in vogue, solid state technologies supplanted tubes. Better performing, narrow band crystal controlled units, like the Sonar FR-105, followed. These units did not scan, rather channel selection was accomplished using a simple rotary switch. Sonar even made a 24 channel unit, model FR-2513, in which crystals were held in a rotary "turret."

The earliest scanners, like the 1968 vintage Bearcat BCH, BCL, and BCU models, did not provide individual channel lockout capability. Electra didn't use the term "scanner" and instead called these innovative radios "business receivers." Other models, like the SBE Sentinel, employed a "Channel 1 Bypass" switch so a user could lockout channel 1.

The first scanners came in single band models, followed by multiband models. As two-way radio users started to populate the 450 - 470 MHz band, consumers were forced to pay a premium for UHF scanner coverage. Some multiband scanners, like the Electra's Bearcat III, required an optional circuit board for each band.

There were scanner mutations, designs which never evolved -- odd combinations of AM broadcast receivers with VHF-FM receive capability, like the flamboyant turquoise Sonar Sentry FR-103 portables, Electra's Jolly Roger, and GE's Surveyor series (see US patent 4,011,515, granted 3/8/77). Lafayette Radio Electronics offered a few CB transceivers with VHF receiver capability. These poor performers didn't interest consumers of that era and you should avoid these models unless you are a scanner collector.

The first programmable (crystal-less) scanners were difficult to program. Users had to look up frequencies in a code book and tediously program the information into the scanner in binary form. Some models, like the Tennelec MCP-1 (see US patent 3,961,261, granted 6/1/76), Bearcat BC-101 (see US patent 4,179,662, granted 8/4/78), and Radio Shack COMP 100, resembled Altair or PDP-8 computers, with a row of 16 or so toggle switches. Instead of toggle switches, the Regency WHAMO-10 was programmed by breaking teeth from metal combs. See US patent 4,057,760, granted 11/8/77. The GRE-manufactured SBE Optiscan (and its Sears clone) required poking or covering a series of holes in plastic cards which were then inserted into a slot on the front panel.

Keyboard Programmable Scanners

Both Bearcat and Regency, as well as Radio Shack offer some good models. I would avoid the Bearcat 100, and older scanners made by AOR, JIL, Fox, Tennelec, and Robyn.

Scanner features often differ not only by model but by manufacturer. For instance, most Radio Shack and Bearcat programmables allow enable/disable of the delay function on a per-channel basis. Older Regency units permit the delay to be enabled/disabled only globally, that is, for all the channels at one time.

All the older Radio Shack scanners were made by General Research Electronics (GRE). Uniden began making scanner models for Radio Shack in the late 1980s, and now supplies about half the Radio Shack scanners. The older GRE-made models scan a bit slowly and have a higher level of synthesizer noise. Most have too much hysteresis in the operation of the squelch control, but this can be fixed completely by replacing one resistor. Good, detailed shop manuals are available for Radio Shack units for $5 - $12.

In the name of cost cutting, some models have done away with the concept of a "channel bank", i.e. the ability to select/deselect a group of channels at a time. The bank concept was a good one. It may be inconvenient to operate a 30 channel scanner without banks (e.g. Regency MX3000, HX1000) if you operate the way many scanner hobbyists do.

If you want to buy an American-made scanner, you will have to buy an old model. Until the mid 1980s, rivals Regency and Electra (Bearcat) built most of the scanners in their Indiana and Puerto Rican factories. Uniden, a large Japanese electronics company, purchased the scanner product lines of both competitors and moved production to Asia.

My favorite VHF/UHF receivers are the the Uniden/Bearcat BC9000XLT, the 400 channel Radio Shack PRO-2005 and PRO-2006, and the ICOM R7000, R7100, and R8500. The ICOM models are more "communications receiver" than a conventional scanner.

For portable use, I prefer the ICOM IC-R2, Uniden/Bearcat BC3000XLT, and older Radio Shack PRO-43.

Obtaining Crystals

If you do purchase a crystal controlled scanner or monitor receiver, you will probably want to buy more crystals to cover local frequencies.

Scanner crystals may be ordered from your local Radio Shack store or from one of the companies below. Be sure to specify the operating frequency you want and the brand and model of scanner.

Some companies may ask you to send a schematic of the scanner or require more detailed information, like series or parallel resonance, load capacitance, etc.

Electra Corporation stocks crystals for the Bearcat scanners:

Electra Corporation
11915 E. Washington St.
Cumberland, IN 46229
Phone 317-894-3229

Crystals for Bearcat and other models are available from:

American Crystal Co.
1623 Central Ave.
Kansas City, KS 66102
tel. 913-342-5493

Bomar Crystal Company
201 Blackford Ave.

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.]

Introduction

The original Bearcat scanner line was manufactured by
Electra Company, a division of Masco Corp of Indiana. In
the mid 1980s, Uniden, a Japanese company, bought out the
Bearcat scanner line and Uniden's first Bearcat scanner was
the BC800XLT model.

Most of the models discussed in this article are
base/mobile units made by Electra during the 1970s and
1980s although some of the capacitor failures occur in the
Uniden BC800XLT, too.

Electra stamped all of its scanners with a manufacturing
date code on the rear of the cabinet. The code is comprised
of a single character (C = Cumberland, Indiana, P = Puerto
Rico), followed by four digits denoting year and week the
radio was built. For example, "P8422" denotes the radio was
made in the Puerto Rico factory during the 22nd week of
1984.

One way to roughly estimate a radio's age is to examine the
4 digit date codes often stamped on the integrated
circuits. The radio must have been made after the most

recent date stamp.

Schematics, Owner's Manuals, and Parts Available

The re-incorporated Electra Corporation sells crystals, antennas, power cords, owner's manuals ($11 ea) for some older (pre-Uniden) Bearcat scanners. Electra Corporation is located at 11915 E. Washington St., Cumberland, IN 46229. Phone 317-894-3229, email: electra@tcon.net,

I cannot furnish schematics, manuals or parts. To order a user manual for an Electra/Bearcat scanner from Uniden, call (800)235-3874 extension 2553. You can also download an electronic copy of the user manual for recent Bearcat models from the Uniden web site:

http://www.uniden.com/docs/service/support.htm

Some schematic diagrams may be obtained from Uniden's parts department, (800)297-1023. Uniden currently charges a flat rate of $54 for scanner repairs. They will repair and return "out of warranty" items without an estimate unless the repair charges exceed the flat rate charges.

The phone number for repair is (800)297-1023, too. I recommend you call repair before sending the broken scanner. Items for repair via UPS (include receipt if still under warranty) are usually sent to:

Uniden America Corp.
4700 Amon Carter Blvd.
P.O. Box 95002
Fort Worth, TX 76155

If Uniden doesn't have a schematic, try obtaining a Photophacts from Howard Sams Publishing division of Prentice-Hall at (800)428-7267, http://www.samswebsite.com

G & G Communications (telephone (716)768-8151) is a family owned company which repairs scanners and stocks parts for several older models, especially Electra/Bearcat and Regency brands, but they don't sell manuals or schematics. They are located at 7825 Black Street Rd., LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

Common Construction

Most of the classic, metal-cased Bearcat base/mobile models were built using two printed circuit boards:

1. a "radio board" containing the synthesizer, RF, IF, and audio stages, and
2. a "feature board" containing the microprocessor

controller and memory circuitry which gave each model its own personality.

Although there are various vintage radios boards, they all have similar circuitry.

Bad Solder Joints Common

Before addressing specific symptoms, circuit boards in the malfunctioning scanner should be inspected for poor solder joints.

The Electra/Bearcat BC350, BC300, BC250, BC220, BC20/20, BC211, BC210, and BC210XL models were hand assembled, and every one I've serviced had several connections that were either soldered poorly, or not soldered at all.

Resoldering joints on the ribbon cable connecting the RF and keyboard logic circuit boards in a BC250 attenuated the microprocessor/synthesizer hash noise noticeably.

A Bearcat 20/20 was experiencing periodic loss of memory on some, but not all channels. When the problem occurred, the frequencies on some channels would be completely changed. On other channels, the frequency would still be intact, but the channel would be locked out, and the delay toggled from "on" to "off". Some channels were not affected.

The 2 "AA" memory backup batteries, and their holder, tested good. Much time was spent tracing logic, heating and cooling components, and making voltage measurements.

One of the secondary leads from the power transformer was connected to the main circuit board through a hole drilled through foil traces on both the top and bottom sides of the board. A close examination revealed that this lead had been soldered only on the top of the board - the bottom side had never been soldered.

Soldering the lead on both sides of the board solved the memory loss problem.

Matt Roberds fixed a BC220 which experienced memory loss if power was removed by resoldering the positive wire to 2-AA battery holder.

As built, the BC220 logic board is grounded only through its mounting screws. In the BC220, Matt recommends adding real wire ground jumpers from the main board to the feature (logic) board to fix grounding problems.

Symptom: Blank Display

The BC300 scanner, and several other Bearcat models, employ a switching type power supply stage to generate plus and minus voltages in excess of 20 volts DC. When this switcher fails to function, the display goes blank, but the squelch control appears to work, and white noise can be heard in the speaker.

In almost a dozen of the BC300 and BC800XLT scanners I've fixed, C98, a capacitor in series with the primary of the switching transformer failed, causing the output of the supply to drop below the level needed to power the display. The switching transformer is mounted on the RF circuit board, and is much, much smaller than the main power transformer, which is usually fastened to the metal chassis. See March 1996 Monitoring Times magazine for BC800XLT capacitor locations and repair information.

The 22uF/16V capacitor used for C98 in early BC300s was marginal, and was replaced with a 47uF/25V capacitor in later units.

Jim Craig and Karl Klein repaired their BC210XWs by replacing the 22uF/35V C98 capacitor.

Paul Grohe replaced a failed C98 with a low ESR (equivalent series resistance), high frequency, switching regulator grade capacitor, e.g. a Panasonic HF series capacitor. He also recommends adding a 0.1 ceramic capacitor in parallel with C98.

I replaced the 22 uF capacitor in the switching power supply stage of a BC210XL which caused the same symptom. Other capacitors in the switcher stage have failed. C114, a 4.7 uF/35V tantalum capacitor failed in at least one BC250, causing the display to blank.

A more sinister problem affects the switcher in earlier models. The switching supply stage in the BC250 and original BC210 is driven by a clock signal derived from a custom Exar NC57902 divider integrated circuit (designated IC6 in the BC250 scanner). I've seen this divider IC fail in several BC250s, causing a blank display (except for a decimal point in the BC250's rightmost digit). This custom IC is no longer available from Uniden.

Failure of IC9, the 9 volt NJM78M09A regulator in a BC800XLT is another cause of a blank display.

Symptom: Invalid Frequency Displayed

A common Bearcat 250 malady is manifested by an invalid frequency displayed on the readout. This display is temporarily "cured" by unplugging the AC line cord from the wall, then replugging it. This condition is symptomatic of

a power supply problem in which Q204, a Texas Instruments TIP-29 located on the feature circuit board, fails.

A Philips ECG291 will work as a substitute for the TIP-29. Don't try a Radio Shack substitute, it hasn't worked. See Martin Toomajian's article, "Bearcat 250 Erratic Display Cure", in January 1987 Monitoring Times.

A similar problem in the Bearcat 20/20 was discussed previously in the section on bad solder joints.

Matt Roberds repaired the Montgomery Wards version of a BC220 and contributed these insights:

"I did add some heat-sinks, but you have to be careful what you do with the TIP29 on the logic board. I added a long, flat heatsink to it and immediately created a whine in the audio. I didn't use an insulator, as this was a temporary first-try. As far as I can tell, the heatsink was radiating noise from the logic board into the front end on the radio board, which ended up being just below the heatsink. Bypassing the TIP29 (a voltage regulator) with disc ceramics didn't work; using a smaller heatsink and an insulator fixed the problem."

"There is also a 220 ohm 1/4 watt resistor on the logic board. It feeds the TIP29 from the main +16v supply. It looked a little crispy. I pulled one end and measured the current through it and it was about 30-35 mA. This works out to right at 0.2-0.25 watt dissipation. I didn't have a higher-wattage resistor, so I substituted 2 470-ohm resistors in parallel."

Symptom: Squelch Won't Eliminate White Noise

Most Uniden/Bearcat base/mobile scanners feature an AUTO squelch position, actuated by rotating the squelch knob fully counter clockwise. The BC350 used a separate pushbutton switch for this purpose. These scanners use a flimsy potentiometer (designated R81 in BC300s) internally mounted on the RF circuit board, to set the level of signal required to open the squelch when in the AUTO position. This pot also has an effect on the squelch action in the non-AUTO mode, and determines at which point the squelch knob must be positioned in order to silence the radio.

Although the potentiometer is adjusted at the factory, changes in component values due to aging often necessitate readjustment of this internal pot. Misadjustment of this pot has been the cause of "no squelch" complaints in two BC300s and a BC250 I fixed.

Another squelch failure is due to a blown transistor that acts as the electronic switch in the squelch circuit. I replaced this transistor in only one BC300, so I don't know if this is a common problem.

Symptom: Scanner Completely Dead

In Bearcat scanners using an internal power supply (e.g., BC350, BC250, etc.), the main power transformer is connected directly to the AC line. Since the on/off switch is on the secondary side of the transformer, current flows in the primary as long as the AC line cord is plugged into an active AC outlet. These transformers contain an internal circuit breaker, not visible without unwinding (destroying) the transformer. The internal breaker is known to fail prematurely in a batch of Bearcat power transformers.

If your scanner is completely dead, check the primary of this transformer for an open circuit condition.

Symptom: Keyboard Bounce

After much use, the Chromerics keyboards in Bearcat scanners start to wear out. The first sign of trouble is usually keyboard bounce on the most frequently used key, e.g., the MANUAL key. Replacement keyboards are usually available from UNIDEN, but replacement requires dexterity, as one must take care not to tear the flat, flexible strip connecting the keyboard to the logic board.

Symptom: Keyboard Completely Unresponsive

The keyboard matrix is "scanned" by the microprocessor. Another problem is when none of the keys seems to function; the receiver just keeps scanning in spite of key depressions. I found this condition in a BC210XL scanner owned by a heavy smoker. Perhaps nicotine smoke was to blame, as the resistance between two input port pins on the microprocessor was down to about 1000 ohms, fooling the microprocessor into believing that a key was stuck in the "down" position. Scraping the circuit board between the two pins with an X-Acto knife fixed the problem.

Uniden/Bearcat BC200XLT Portable
Loss of Audio and Dial Lamp

If you can program frequencies into your BC200XLT but there is no audio and the green backlight no longer functions, a tiny transistor may have failed.

Check for a defective PNP surface mount transistor, Q201 (2SB815B6-YDY). Q201 is used as a switch to furnish 8 VDC to several stages of the BC200XLT. Its main purpose is to

switch off power hungry stages of the BC200XLT when the CPU thinks the NiCd voltage has fallen below a threshhold. That's an attempt to limit the current drain on weak NiCds to avoid permanent damage.

Q201 is located on the foil side of the "Micom" board, adjacent to the black multi-pin connector which mates the Micom and main boards together.

Q201 can be destroyed by a few different causes, primarily, by something in the scanner drawing too much current through it. In one case, capacitor C36 shorted. It's a 220 uF 10v electrolytic, located on the component side of the main board, connected from pin 8 of the audio IC (IC2 NJM386SL) to ground. Capacitor C55 shorted in another BC200XLT. Gary Bean reports he substituted a 2SA1298 for Q201 and it worked fine. In a pinch you bypass Q201 by soldering a short piece of bare wire between the collector and emitter, but you must first fix the component which caused Q201 to fail.

BC9000XLT: Loss of Sensitivity

John Ward has fixed two BC9000XLTs which suffered from "low sensitivity." He fixed the solder joint where the antenna jack connects to the circuit board. In both cases the tab from the board was on the opposite side of the jack from where the little blob of solder applied at the factory was located.

It was an intermittent problem that depended upon the position of the antenna cable - if the weight of the cable placed tension on the jack in one direction contact was made and the radio worked fine. If the cable placed tension on the jack in the opposite direction contact was lost and so was reception. The gap was barely noticeable.

Other Problems

Complaints of low audio output and occasional microphonics in three Uniden/Bearcat 800XLTs were caused by a bad 47 ufd electrolytic capacitor in series between the external speaker jack and audio amplifier.

Andy Domonkos reports he often uses a tape recorder connected to a Uniden/Bearcat BC890XLT. RL-1, the carrier activated relay inside the BC890XLT wore out. Andy found the identical relay sold at Radio Shack (part #275-232) and says the BC9000XLT uses the same relay, too.

Replacement Bulbs for BC760XLT

The Uniden BC760XLT's SCAN, MAN, PRI, and HOLD buttons are illuminated by "grain of wheat" type incandescent bulbs. Gary Saffer reports that the bulbs and buttons are located on a small printed circuit board which sits behind the radio's face plate. Gary unsoldered the burned out bulbs in his radio and replaced them with 12 volt Radio Shack bulbs (#272-1092c). They should last a long time when powered by the 8 VDC supplied by the BC760XLT.

Open Resistor in BC140

Robert Casey fixed his deaf, 16 channel Bearcat BC140 scanner. A 10 ohm resistor had opened that fed a circuit that generates 22V for the varactor diode tuner circuits. Without the 22V, there was no tuning of the local oscillator and front end, and no reception. What he did was compare voltages to a second working BC140.

Sources for Replacement NiCd Battery Packs

Replacement NiCd battery packs and inserts for the BC100XLT, BC200XLT, BC2500XLT, BC3000XLT, and other scanners are available from Uniden. I've purchased them at lower cost from:

1. Mr. NiCd - E. H. Yost and Company, 2211-D Parview Rd., Middleton, WI 53562. tel. (608)831-3443. email ehyost@midplains.net

2. Battery-Tech Central, 2818 Southland Street SW, Cedar Rapids, IA 52404-4141. tel. (800)267-3087 or (319)364-0855.

Batteries Plus has stores across they country and some have rebuilt Uniden NiCd packs for under $20.

Add a Plectron or Motorola Alert
Desktop Monitor Receiver
to Your Scanner Collection

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner, and
rec.radio.info. It is also available electronically from
the rec.radio.scanner ftp archive on the official USENET
FAQ library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

In the 1960s and 1970s, thousands of firemen and ambulance
squad members came to rely on their crystal controlled,
transistor Plectron and Motorola desktop monitor receivers.
They have now been replaced by battery operated portable
pagers, and the desktop models are often available at
hamfests in the $5 - $25 range. Since many are in rough
condition and need repair, a hamfest special is better
suited for hobbyists who like to fix their own radios.

Plectron and Motorola crystal controlled receivers are
excellent for dedicated monitoring of local frequencies --
a task for which you wouldn't want to tie up your 400
channel programmable scanner. They are desktop models
which can be powered from 117VAC or 12VDC with the proper
mobile cord. The audio quality of a Plectron P1, Plectron
700 series, and Motorola Alert Monitor is far better than
any consumer grade scanner and the sensitivity, image
rejection, and intermod immunity is outstanding when
aligned properly.

Models and Frequency Coverage

The Plectron and Motorola Alert monitors are single band
receivers: VHF-low, VHF-high, or UHF. No single Plectron
or Motorola Alert monitor can cover the entire 30-50 MHz

band, so there were versions optimized for each portion of the VHF-low band. There were different versions to cover low and high "splits" in the VHF-high band, too. For example, low band R8000s come in 30 - 35, 35 - 39, 39 - 49, and 49 - 54 MHz versions. There are two VHF high band versions of the 700 and R8000: 148 - 158 and 158 - 175 MHz.

VHF-low band Motorola Alert monitors come in two splits: 30 - 42 and 42 - 54 MHz.

Although UHF versions of the 700 series were made, they are somewhat rare and coverage is limited to 470 MHz and below.

Plectron made several models with dozens of different options. Both the original P1 and later 700 series are suitable for restoration, although I prefer the newer 700 models. The 8000 series were even newer and very desireable, but they are difficult to find at hamfests. The Plectron 500 "economy" series is less desirable.

The P1 series have black cabinets with a blue-green and silver color scheme used on the front panel. They were made in the Chief (tone decoder & carrier squelch), Patrol (carrier squelch only), and Sentry (tone only) models. The Sentry models lack a carrier squelch and therefore are of little use to hobbyists except for scavenging parts. Model number and frequency information appears on a gummed label on the rear panel:

Band (MHz) Chief Patrol Sentry

_____
25-54 R19 R15 R17
148-174 R20 R16 R18
450-470 R23 R21 R22

Table 1. Plectron P1 models

The R700 series have black cabinets with brown front panels and are slightly smaller than the P1 receivers. R700s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

_____
25-54 R719 R715
148-174 R720 R716
450-470 R723 R721

Table 2. Plectron 700 models

The R8000 series are much smaller than the P1 and R700 and are housed in metal cabinets of various colors. The R8000s use the same MC3357 IF/detector/squelch IC used in crystal

scanners, but their crystals are not interchangeable with ordinary scanners. R8000s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

30-54 R8190 R8150
148-174 R8200 R8160

Table 3. Plectron 8000 models

The Plectron FM Receiver/Recorder is a collector's item. It is essentially a 700 series Chief receiver with a built in cassette tape recorder. The recorder is carrier activated and can tape transmissions while the receiver is unattended. A connector on the rear panel allows for all kinds of remote control possibilities.

The tape recorder inside the Receiver/Recorder employs two rubber belts. The Projector Recorder Belt Company makes replacement belts which work fine, though they may not be the original equipment:

1. PRB SCA8.6 (218 mm)
2. PRB SCQ 2.5 (64 mm)

I use two Plectron P1s and four R700s in my living room, seven R700s down the basement, and several Plectrons and Alert Monitors stored in reserve. The basement Plectrons are turned on automatically when someone walks downstairs. Power to them is controlled by a modified Radio Shack Safe House infrared motion detector, originally sold as an intrusion alarm.

When a rescue squad member from Missouri advertised a number of Plectrons on USENET, I bought them -- all 20+ of them. I cleaned, fixed, and restored each one. After recrystalling them on local frequencies, I distributed them to members of my scanner club who were glad to get them.

Crystals

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency.

The best source for crystals is:

International Crystal Mfg Co.
11 N. Lee Ave
Oklahoma City, OK 73102
tel. 405-236-3741, 800-725-1426

You need not bother with calculating the crystal
fundamental frequency. Merely supply International with
the exact receiver model number, printed on the rear label,
and the frequency you want to monitor. They will perform
the necessary calculations.

Crystals for Plectrons

The Plectron P1 series contain two crystals. The second
local oscillator crystal is 11.155 MHz regardless of band.
On VHF high band (148 - 175 MHz), the P1 series employ this
formula for the first local oscillator crystal:

Crystal frequency (MHz)
= (station freq (MHz) + 10.7) / 4

or

Crystal frequency (MHz)
= (station freq (MHz) - 10.7) / 4

On VHF low band (25 - 54 MHz), the P1 series employ this
formula for the first local oscillator crystal:

Crystal frequency (MHz) = (station freq (MHz) + 10.7)

or

Crystal frequency (MHz) = (station freq (MHz) - 10.7)

There are two crystals (Y1, Y2) used in the Plectron R700
series, one for each local oscillator. The crystal
formulas are:

RF Range (MHz) Y1 (MHz) Y2 (MHz)
_____
25-29 (f+10.7)/3 11.155
29-32.6 (f+10.7)/3 11.155
32.5-35 (f-10.7)/2 10.245
35-41 (f-10.7)/2 11.155
41-47 (f-10.7)/2 11.155 (use 10.245 MHz
for Y2 on 44.62 MHz)
47-54 (f-10.7)/3 11.155
148-158 (f-10.7)/9 11.155
158-175 (f-10.7)/9 10.245
450-470 (f-10.7)/18 11.155

The economy Plectron 500 series use this scheme for the
first local oscillator crystal:

RF Range (MHz) Crystal (MHz)

---

25 - 35 (f+10.7)
35 - 54 (f-10.7)
148 - 174 (f-10.7)/4

Most Plectron 500s use an 11.155 MHz second local oscillator crystal. However, a 10.245 MHz crystal is used instead for receivers in these ranges: 33.4 - 33.78, 44.62, and 158.78 - 158.82 MHz.

Power Cords

AC power cords for both types of receivers use unique connectors and are scarce. I published the pinout for both Plectron and Motorola Alert Monitor receivers in June 1998 Monitoring Times magazine.

You can buy the proper replacement power cords but it's much cheaper to drill a hole on the rear panel and solder on a permanent a power cord. Make sure you use a grommet in the hole to prevent the metal chassis from chafing the line cord.

Many Plectrons and Alert Monitors were equipped with an internal NiCd battery pack, intended to power the receiver if the AC power fails. It's unusual to find a used monitor receiver with the NiCd pack still capable of holding a charge. More often, the batteries have died and the series charging resistor has overheated and burned. Be sure to remove the dead batteries as they often leak.

Squelch and Minimum Volume Setting

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Both Plectron and Motorola Alert monitor receivers are designed purposely to have a minimum volume setting which is still audible. The intent was to prevent firemen from turning the volume down completely, forgetting it was down, then missing an important call.

This "feature" was usually implemented by having a fixed value resistor in series between one end of the volume control and ground. In the R15X5, R14X5, R15X5, and R16X5, a 47 ohm resistor, designated R624, was inserted in series with the violet wire leading from the volume control.

You could decrease the lowest volume setting by decreasing the value of this fixed resistor. Alternatively, you could replace the resistor with a jumper wire to completely

silence the receiver at minimum setting of the volume control.

Tone Alert Feature

I have not used the Plectron tone alerting features so I cannot address that except to say that the special coils and capacitors for the dual tone decoders vary depending on the tone frequencies and are somewhat difficult to obtain.

Repair and Replacement Parts

Repair service and replacement parts for the Plectron P1 and R700 models is offered by:

Weber Electronics
PO Box 212
5138 Laurel Ln.
Broad Run, VA 20137
telephone (540) 347-7760
email: weber@citizen.infi.net

Alert Monitor parts are available from Motorola. Phone (800)422-4210. The part number on the service manual for my VHF-high band monitor is 68P81048A55-G and my VHF-low band manual bears part number 68P81050A95-D.

John Miller reports the current price is $5.70 for service manuals. Motorola advised John that Alert Monitor parts are scarce, with last stocked being in 1995, Knobs are no longer available, though there are many that would fit.

Plectron SM-series Scanning Receivers

Plectron also sold an SM series of scanners, manufactured in Japan by the same folks who made Craig (division of Pioneer) scanners. The SM series are consumer-grade models and are included in this article for the sake of completeness. They are crystal controlled radios and feature priority scan and a separate trimmer capacitor for each channel to net the crystals on frequency.

Band Frequency Limits

VHF-low 30 - 50
VHF-high 150 - 174
UHF 450 - 470 MHz

Table 4. Plectron SM Model Band Limits

Model UHF VHF-high VHF-low

SM-301 X X X
SM-302 X X

SM-303 X X
SM-304 X X

Table 5. Plectron SM Models

The crystals used in the SM series are quite different from the crystals used in the conventional single channel Plectron monitors. Here are the crystal formulas:

VHF low band:
crystal 3rd overtone freq = receive freq + 10.7 MHz

VHF high band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz)/3

UHF band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz) /
10

Other crystal specifications for the SM series are:

CR 25/U holder
3rd overtone
20 pF load capacitance
parallel resonant
max series resistance 40 ohm
max drive 2 mW

Plectron Alternatives

Too bad Plectron is out of business. TCS Communications Corp. sells used Plectron receivers, in working condition, for $75-100. If you require crystals or reeds, TCS may be able to find some types/frequencies. Contact:

Terry Marengi
TCS Communications Corp.
tel. 1-800-TCS-XMIT
email: TERRYTCS@aol.com

If you wish to purchase a new receiver with "Plectron-like" signaling capabilities, contact Reach Electronics:

Reach Electronics
1311 West Pacific
Lexington, NE 68850
(308) 324-6661
(800) 445-0007
FAX: (308) 324-4985

Reach sells tone & voice pagers, Alert monitors, and ENCODERS. They also do contract manufacturing.

I currently have no Plectrons or Motorola Alert Monitors for sale. I'm hoarding them. :-)

(see below). Tinley Park Convention Center, 185th St. & |
Harlem Ave. 9:30 AM - 3 PM. Adults $6, children $2. |

APRIL 2001 |

Apr 1 (Sun): Wheaton, IL - Giant Computer Show & Sale (see |
below). DuPage County Fairgrounds, County Farm Rd. & Man- |
chester Rd. 9:30 AM - 3 PM. Adults $6, children $2. |

COMPUTER SHOW NOTES

Computer Central computer shows are held at the College of DuPage, Main Arena of the Physical Education Building Park Blvd & College Road, Glen Ellyn, Il. 847-940-7547. $5 admission with card, normal admission $6.00. Opens 9:30 am - 3:00 pm. See http://www.computercentralshows.com web site.

Giant Computer shows are held by Micro Media, Inc. Shows |
are usually held at the Tinley Park Civic Center, 185th St. |
& Harlem Ave., Tinley Park, IL or at the DuPage County Fair-
grounds, County Farm & Manchester Rds., Wheaton, IL. Admis-
sion is $6. Show hours are 9:30 AM - 3 PM. To get on the mailing list or get more information, call (708)974-3123. See http://www.giantcomputershow.com

Computer Country Expo is Lake County's largest computer expo. The event is held on designated Saturdays from 9:30 AM to 3:00 PM. This show features computers, supplies, games, parts, software, accessories, CD-ROM, monitors, diskettes, printers, keyboards, modems, disk drives, cables, expansion boards, services, etc. Lake County Fairgrounds, Route 120 (Belvidere Rd.) & Route 45, in Main Exhibit Hall Building #1=9720,000 sq. feet. For a show map, exhibitor info, and discount coupon, visit the web site at http://www.ccxpo.com.

IMPROVE THE SQUELCH IN YOUR MONITOR RECEIVER

Copyright 1988 - 1999 by Bob Parnass, AJ9S

[NOTE: The first version of this article appeared in the RCMA Newsletter, December 1988. It may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. It is posted twice monthly on the USENET groups rec.radio.scanner, alt.radio.scanner, sci.electronics.repair, and rec.radio.info. It is also available electronically from the rec.radio.scanner ftp archive on the official USENET FAQ library ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.]

The squelch control in some FM monitor receivers is difficult to use because of too much hysteresis. The American Heritage Dictionary of the English Language defines hysteresis as the:

o "Failure of a property changed by an external agent to return to its original value when the cause of the change is removed."

It's like having play in a car's steering wheel, or backlash in a gear set. Too much hysteresis in a squelch circuit forces one to keep the squelch at a tighter setting, missing weaker signals when scanning or searching. The squelch hysteresis problem was first addressed in a 1984 article about the Radio Shack PRO-24 crystal controlled scanner.

Why do engineers design these circuits with any hysteresis? Basically, hysteresis prevents weak signals from "popping" the squelch open and closed rapidly, which would be very annoying to the listener. A squelch circuit with hysteresis requires a stronger signal to open the squelch than it does to keep it open.

Models cursed with too much hysteresis include the Uniden/Bearcat 800XLT and 760XLT, Radio Shack PRO-2003, PRO-2004, and others. Don't despair, the fix is simple for most radios. I've successfully reduced the squelch hysteresis by replacing a single resistor.

Hysteresis is usually implemented by providing feedback from the squelch gate input to output, through a resistor. The higher the resistor value, the less feedback there is, and less hysteresis. My modification involves replacing the "stock" resistor with a higher value resistor, as identified in the table below.

This technique does not apply to some of the newer Uniden models, because the squelch hysteresis is partially determined by firmware inside the processor IC.

This article cannot provide step-by-step instructions for each radio. I always encourage radio hobbyists to purchase the service manuals for their equipment. The most useful sections of the manual are the schematics and printed circuit diagrams. Good manuals will also describe the theory of operation and alignment procedures, and contain a complete parts list.

If your radio has too much hysteresis, and is not listed in the table, study the service manual. Motorola MC3357, MC3359, and MC3361 integrated circuits, which contain IF and squelch circuitry, are popular in scanners. In these receivers, look for the hysteresis resistor to be connected to these ICs.

Notes

1. The author cannot furnish modification information for other radios.

2. Don't attempt this, or any other internal modification, unless you are skilled in electronic servicing.

3. Make sure your receiver is disconnected from any power source before opening the cabinet.

4. If space permits, you can replace the stock resistor with a higher value variable resistor ("trimpot") and adjust to suit.

Table 1. Squelch Hysteresis Resistor In Selected Receivers

Squelch Hysteresis Resistor In Selected Receivers		
Receiver Model No.	Res-istor Value	Stock Comments
Radio Shack PRO-24	R35	33K replace with 220K. Located between pins 12 and 14

	of MC3357 (IC1)
Radio Shack PRO-2002	R197 47K try 220K.
Radio Shack PRO-2004	R148 47K remove R148
	or replace with 220K.
	On linear board,
	between pins 12 & 14

REPAIR TIPS: RADIO SHACK SCANNER RADIOS

Copyright 1997 - 2001 by Bob Parnass, AJ9S |

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner,
sci.electronics.repair, and rec.radio.info. It is also
available electronically from the rec.radio.scanner ftp
archive on the official USENET FAQ library
ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.
The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.]

Introduction

Radio Shack has been selling scanners and monitor receivers
under the Realistic and Radio Shack labels for over 30
years. Most of them were manufactured by General Research
Electronics of Tokyo, though many newer models are
manufactured by Uniden.

The date of manufacture is usually printed on a gummed
label on the scanner as well as the cardboard box. A code
of 12A5, means the scanner was made in the 12th month of
1975, 1985, or 1995, for example.

There's another way to date Radio Shack scanners
manufactured by Uniden. The first digit of the long serial
number is usually the last digit of the year of
manufacture.

Another way to roughly estimate a radio's age is to examine
the 4 digit date codes often stamped on the integrated
circuits. The radio must have been made after the most
recent date stamp.

Schematics, Owner's Manuals, and Parts Available

I cannot furnish schematics, manuals or parts. Service manuals for most Radio Shack scanners sold through mid-1997 may be ordered through your local Radio Shack store.

If Radio Shack doesn't have a schematic, try obtaining a Photophacts from Howard Sams Publishing division of Prentice-Hall at (800)428-7267, http://www.samswebsite.com

Parts lists for recent and many older models are available on line at: http://support.tandy.com. Parts may be ordered through Tandy National Parts, telephone (800)241-8742, or through your local Radio Shack store. You may be able to obtain some technical assistance from Tandy by calling (800)843-7422, option 2. The RSU (Radio Shack Unlimited) phone number is (800)-433-2024.

G & G Communications (telephone (716)768-8151) is a family owned company which repairs scanners and stocks parts for several older models, especially Electra/Bearcat and Regency brands, but they don't sell manuals or schematics. They are located at 7825 Black Street Rd., LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

GRE-Built Base Models: Dim Backlight

The backlight in many base models, including the PRO-2022, PRO-2004, and PRO-2005/6 is implemented by an electroluminescent panel, which grows dim with use.

The EL panel used in the PRO-2005 and PRO-2006 is designated EL-501, and is identified by Radio Shack part #10800050. A new EL panel can be ordered through your Tandy National parts (see above) or local Radio Shack store and sent to your home. Radio Shack no longer sells replacement EL panels for the PRO-2004, but Robert Cummings has modified an LCD from a Miller Engineering (http://www.microstru.com) experimenter's kit and fitted it to his PRO-2004. See http://home.cfl.rr.com/scan/Backlight.html for details.

Replacing the backlight is an operation which requires care and patience. Purchase a service manual, and study the exploded parts diagrams as you read the following steps.

Top and bottom cabinet pieces must be removed, then the speaker unplugged from the main board. The front panel assembly must be removed from the chassis by removing 4 flat head screws, 2 on each side. You need not disconnect all the wiring harnesses, though you might have to unplug one so it won't get in the way of a hot soldering iron.

Unsolder the bare ground wire soldered to a large shield on the back of the front panel, located near the back of the

squelch control. Two ground braids must be temporarily disconnected by removing the screws which fasten them to the chassis. After removing the volume and squelch knobs, you must remove 8 small screws which fasten the plastic front panel to the diplay board.

The old EL panel is fastened by a bead of glue and two foil type leads soldered to the display board. It's easier to cut the two leads from the old EL panel before unsoldering. A sharp knife should be used cut away the glue. The old EL panel can then be slid gently out from behind the LCD display.

The new EL panel can be installed by reversing the process, though I found that it is not necessary to glue the new panel. The two foil leads must be soldered using a minimum of heat. Reassemble the pieces in reverse order of disassembly.

GRE-Built Portables: Worn Out Keypads

The keypad on late model GRE-made Radio Shack portables, e.g., PRO-39 and PRO-43, can become unreliable after prolonged use. The best repair is to replace the rubber keypad instead of trying to restore contacts using chemicals. A replacement rubber keypad (PRO-43 keypad is RSU#10789808) may be ordered inexpensively through Tandy National Parts or your local Radio Shack Store.

PRO-43: Loss of Audio

Early PRO-43s were built with a 200 mW speaker (mfr's part #EAS-3P123A). The voice coils in some of these speakers have opened, resulting in lack of audio output, though audio is still available from the earphone jack. A more capable 500 mW speaker is available through Tandy as replacement (EAS-3P127).

PRO-43: Freezup

If you attempt to lock out all 20 channels in a memory bank, then scan only that bank, your PRO-43 will freeze up and be placed into a catatonic state. Use the procedure documented in the PRO-43 user manual to fully reset the scanner. This will "break the trance," but all the memory channels will be cleared.

PRO-2004: Dead

If your PRO-2004 is completely dead, check R235, a 1 ohm, 1 watt resistor mounted vertically on the main board.

PRO-7A: Channels 1 - 4 or 5 - 8 Dead

If the first or last 4 channels in your 8 channel PRO-7A
crystal scanner are not working and the lamps for those
channels won't light, replace IC4 or IC5 (type 7400A).

library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

Abstract

This article contains product review summaries for more than
70 old and new scanner radios and monitor receivers.

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

Introduction

At last count, there were over 140 scanners and monitor
receivers of various brands in my collection. This article
describes a few of the FM receivers in my collection, and
other models I've tested. It is not meant to be complete.

You may share information with scanner collectors via the
"vintagescanners" mailing list at:

http://www.onelist.com/group/vintagescanners

For more information about old scanners, see:

1. "Confessions of a Scanner Collector," by Bob Parnass,
Monitoring Times, August 1988.

2. "Scanner Collector Primer," by Bob Parnass,
Monitoring Times, May 1995.

I have published full length reviews and modifications of
these scanner models in Monitoring Times magazine:

Mar 1986 - Uniden/Bearcat BC800XLT
Mar 1987 - Radio Shack PRO-2004
Oct 1990 - Radio Shack PRO-2006
Jan 1995 - Radio Shack PRO-2035 vs. Radio Shack PRO-2006
Feb 1995 - Radio Shack PRO-62 Portable
Mar 1995 - Uniden/Bearcat BC9000XLT
Apr 1995 - Uniden/Bearcat BC3000XLT Portable
May 1995 - Uniden/Bearcat BC860XLT
Jun 1995 - Uniden/Bearcat BC890XLT & Radio Shack PRO-2036
Jul 1995 - Radio Shack PRO-2037

Jul 2000 - Electra Tiger Scan TSA portable
Aug 2000 - Phone patches; Identifying scanner crystals
Sep 2000 - Radio Shack PRO-2067 trunk tracking mobile scanner
Oct 2000 - ICOM IC-R3 portable wide band scanner
Nov 2000 - AOR AR3000A wide band receiver
Dec 2000 - Alinco DJ-X2T portable scanner
Jan 2001 - BUTEL ARC2 Software for the IC-R2 |

Note: Reprints of Monitoring Times articles are available
for $3.00 each plus a self-addressed stamped envelope from
Grove Enterprises, 7540 Highway 64 West, Brasstown, NC
28902, tel. (800)438-8155. I don't receive any part of this
reprint fee.

ALINCO

DJ-X10T: 1998 vintage. Rugged construction - metal back.
Multimode frequency coverage 0.1 to 2000 MHz (minus cellular
bands). 20 selectable step sizes from 0.05 to 500 kHz.
Knob atop the radio clicks when rotated and serves as a VFO
knob, channel selector, and menu navigation control.
Several battery pack options for NiCd and alkaline battery
cases. Furnished with an EBP-37N 4.8 V, 700 mAH NiCd pack
and a sturdy 11 hour drop in charging stand. Loaded with

firmware features and complicated to use. Two VFOs and 1200 channels in 30 banks of 40 channels each. Memory banks are cryptically designated, though you can scan combinations of banks. Each memory channel can be programmed with the frequency, an 8 character label, attenuator, a skip (lockout) flag, and mode (WFM, NFM, AM, USB, LSB, CW, AUTO). Very slow 6 ch/sec scan rate. Rescan delay is about 1 second and cannot be disabled or changed. Auto Memory Write stores up to 40 frequencies but does not check for dupes. 20 linkable search banks with labels. Up to 50 frequencies per search bank can be locked out. Digital clock with on/off timer. Battery saver can be disabled. Ability to scan or search for signals above a selectable threshold or channels with a specific mode. Band scope 7 or 40 steps wide. In short, 30 - 1000 MHz sensitivity is good, few birdies and little intermod. WFM broadcast reception very good. The DJ-X10T squelch can be set to one of 10 levels. We had to keep the squelch set to SQ3 or higher, otherwise it opens at inappropriate times, especially when the battery saver is active. The DJ-X10T instruction manual does not specify the IF (intermediate frequency) scheme. Filters inside the DJ-X10T imply 0.455, 10.7, and 45 MHz IFs. Our tests indicate a first IF of 736.25 or 275.45 MHz, depending on the frequency to which the DJ-X10T is tuned. Our DJ-X10T hears images of cellular phone signals clearly in the 1419.9 - 1444.9 MHz range, 550.9 MHz above their actual frequency. For a full review, including technical test results, see Monitoring Times, November 1998.

AOR

AR2700: 1995 vintage. 500 channel portable covering 500 kHz to 1300 MHz. Lots of good features, e.g., 10 linkable search banks, lighted keypad, per-channel attenuator, S-meter, battery meter, optional voice recorder and speech inversion descrambler. Global rescan and pause delays, but no auto store, data skip, nor battery saver. Internally generated noise results in broad birdies on AR2700 tested. Insensitive carrier operated (vs. noise operated) squelch stays closed on signals unless they are moderately strong, causing scanner to skip transmissions of interest. IFs are 287.55/749.25, 58.05, 10.7/0.455 MHz. See "The AOR AR-2700 Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, October and November 1995.

AR5000: 1996 vintage. approx. 30 kHz - 2600 MHz coverage super receiver. Good sensitivity throughout. AM, SSB, CW, FM detectors. Frequency readout to 1 Hz. More features than any other radio. DTMF reader and RS-232 interface included. Multiple settings for IF and AF selectivity, attenuator, AGC, deemphasis, etc. DB9 RS232C connector.

Negatives include low contrast LCD display and difficult user interface. NFM squelch closes slowly, causing noise burst at end of each NFM transmission. Electromechanical relays click at various frequency boundaries, including 400 MHz, producing a clickety-clack noise -- annoying while scanning banks of mixed band frequencies. Great radio, otherwise. See "AOR's AR5000 All-in-One Receiver," by Bob Parnass, in Monitoring Times, December 1996, for a review which includes quantitative test results.

AR8200: 1998 vintage. S/N 550004 tested. Portable, high end "super" scanner covers 0.1 - 2040 MHz (minus cellular in USA version). Not a scanner for beginners. Many of the settings are made through the use of menus. Lots of features. 4 AA batteries, steel belt clip, plug-in AM antenna. 1,000 conventional channels in 20 banks, 10 temporary channels, one priority channel. Each memory channel may be programmed with frequency, label, mode, step, step-adjust, offset, attenuator enable, noise limiter, AFC, and write protect. Multi bank scanning. You can enable a 0 - 9 second rescan delay with each scan group, but not per channel. 40 pairs of search limits with labels. Offset capability for monitoring repeater input frequency. LCD display easy to read. Display and keypad backlit using green LEDs. The band scope. Shortwave reception stone deaf on shortwave when fitted with the supplied antenna or a 19" whip. Seriously overloaded on shortwave by a 132 foot long dipole unless we use the built-in attenuator. Supplied "dorsal fin" antenna for AM BCB. Scans slowly (14 channels/s). Requires more current. Audio quality is slightly above other portable scanners. Computer port. One slot for a single plug-in option: voice inversion descrambler, CTCSS search, 256 frequency tone eliminator, voice recorder and playback, or extended (slow) memory. See AOR AR8200 review by Bob Parnass,in Monitoring Times, October 1998, for review with quantitative test results.

ICOM

IC-R10: late 1996 vintage (serial number 01048 tested). Shirt pocket size multimode is powered by 4 AA penlight cells. Covers 0.5 to 1300 MHz (minus cellular). NFM, WFM, USB, LSB, AM, and CW detectors included. IF bandwidths are fixed. No 30 kHz bandwidth for satellite or FM military monitoring. Battery saver circuit, with selectable duty cycle. Single VFO and 1000 memory channels. There are 900 memory channels divided into 18 banks of 50 channels each. Another bank of 100 channels used to hold unique frequencies found during an auto store operation. 20 pairs of search limits. Up to 100 frequencies may be locked out during a search and stored in a final bank of 100 channels which is

cleared before subsequent auto store searches. Each channel can be programmed with the detector mode (e.g., AM, USB), a tuning step size, an attenuator enable flag, and an 8 character label. CI-V computer interface requires extra cost hardware. 7 segment S-meter. Noise blanker. Good sensitivity. Lighted keypad and display, but keystroke sequences are cumbersome.

Good radio hardware in a handy sized package, but scanning performance unimpressive. Very slow memory scanning at only 6 channels/second. Searches at about 16 steps/second, with little or no worthwhile improvement using the "Signal Navigator" feature in the R10 I tested. Rescan delay cannot be disabled. Can only scan one memory bank or all banks, not a combination of banks. No squelch for SSB or CW modes. See "ICOM IC-R10 Receiver," by Bob Parnass, in Monitoring Times, March 1997, for review which includes quantitative test results.

R-7000: 1986 vintage. At about $1000, this was once the top VHF/UHF receiver. 99 channel, multi mode coverage from 25-2000 MHz with a small gap at 1000-1025 MHz. Memory can be expanded to 198 channels by adding simple switch to pin 19 of memory IC8. Tuning knob lets you tune through parts of the spectrum much easier than using the SEARCH mode on conventional scanners. Selectable USB/LSB allows reception of new amplitude compandored sideband (ACSB) stations. S-meter doubles as discriminator meter to aid tuning. Useful search and store feature, reminiscent of the the Bearcat 250, searches between 2 limits and automatically stores new frequencies into channels 80-99. Audio and control interface for tape recorder. Noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Searches and scans slowly but can be sped up to about 12 cps by adding a resistor. Too big for permanent mobile use, but too nice to leave alone in the car. If you don't want to spend $1000, get a Radio Shack PRO-2004/5/6 instead.

R-7100: 1992 vintage. At about $1300, this is the Cadillac of VHF/UHF receivers. 900 channel, multi mode continuous coverage from 25-2000 MHz. The radio RF/IF/AF portions of the R7100 are similar to the older R7000, but the R7100 is constructed using surface mount parts. Both the R7000 and R7100 are much more immune to intermod than the Uniden/Bearcat 760XLT and the portable PRO-43. The firmware in the R7100 is much more sophisticated. 9 banks of 100 channels. Further, you can associate each channel with 1 of 10 groups. Many possible ways to scan. 10 pairs of search limits. Search and store ("memory write") scan mode lets you store 100 frequencies instead of the 20 in R7000. Another R7100 improvement is that you can program up to 100

channels for the R7100 to skip while searching. R7100 has 2 VFOs ("windows"). Both the R7000 and R7100 scan slowly compared with PRO-2004 and PRO-2006, and that's a drawback. Both the R7100 and R7000 employ a noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Scanning a mixture of VHF and UHF frequencies serenades the ICOM user with a very annoying clickety-clack, clickety-clack! For Baseband Audio out, I mounted an RCA jack on the back of the R7100A and connected it via shielded cable to the junction of resistors R228 and R230 on the Main Unit. This point is located in the vicinity of IC15 and X3 on the schematic.

R8500: 1996 vintage. 100 kHz - 2000 MHz coverage. 20 banks of 40 channels although bank sizes can be changed. 100 Auto store and 100 Skip memories but that can be increased by reallocating channels from the conventional scan banks. Fixed and programmable step sizes. Relays clickey-clack while scanning across band boundaries. Triple conversion, First IF is 48.8, 778.7, or 266.7 MHz, depending on band. Second and third IFs are 10.7 and 0.455 MHz. Weak to moderate cellular images starting near 1106 MHz. Rugged construction. External power supply. DB25 RS232C connector. Audio peak filter. Ok scanning and great searching performance. See "ICOM R8500 Receiver," by Bob Parnass, in Monitoring Times, January 1997, for a review which includes quantitative test results.

UNIDEN/BEARCAT AND ELECTRA/BEARCAT

Bearcat III (Electra): 1976 vintage. 8 channel crystal controlled scanner. Requires optional front-end circuit board for VHF-low, VHF-high, and UHF bands, but only 2 boards can be installed within the radio at the same time. Two crystal filters. No aircraft band coverage nor rescan delay. Front mount speaker sounds good. Strong local oscillator radiation often causes interference with other scanners in the same house.

Bearcat IV (Electra): 8 channel crystal controlled scanner. Newer version of Bearcat III but contains front-end circuitry for VHF-low, VHF-high, and UHF bands. Better selectivity than Bearcat III or 12 due to having three instead of two 10.8 MHz IF filters. No aircraft band coverage. Front mount speaker sounds good. No rescan delay.

Bearcat 5 (Electra): 1979 vintage. Eight channel economy base model covering VHF-low, VHF-high, and UHF bands. 117 VAC only. No track tuning. Black plastic cabinet.

Bearcat 6 (Electra): Six channel VHF-low and VHF-high bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 8 (Electra): Eight channel VHF-low, VHF-high, and UHF bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 12 (Electra): 1979 vintage. One of the last decent crystal controlled scanners. 10 channels. Variable scan speed up to 20 ch/sec. Single delay on/off switch. Front mount speaker sounds good. Manual contains schematic. Single conversion, 10.8 MHz IF. Selectivity is poorer than programmable models, like the 300, allowing adjacent channel interference. Covers VHF-low, VHF-high, and UHF bands but no aircraft band coverage. Crystal positions must be arranged by band.

Bearcat 15 (Electra): 1983 vintage. Actually made for Electra by competitor GRE (General Research Electronics). The only Bearcat crystal controlled base/mobile scanner offering 118 - 136 MHz AM aircraft band. 10 channels.

BC101 (Electra): 1975 vintage. First Bearcat synthesized unit. 16 channels, no priority. Frequency programmed in binary by setting toggle switches on front panel after looking up code in code book. No frequency readout. Uses custom IC for CPU, now discontinued, so factory authorized service is no longer available. I have four of these units. DC operation requires optional mobile power supply.

BC100 (Electra): First programmable portable scanner. Be prepared for at least one repair in the first year. Early units, with threaded antenna connector, have high frequency of repair, particularly LCD readout, keyboard, and battery holder. No battery backup. Poor case design in early units caused battery to disconnect from radio, resetting microprocessor and clearing memories. No priority channel or aircraft band. Some people swear by the BC100, others swear at them.

BC100XLT (Uniden): 1987 vintage. Very good 100 channel portable with 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Generous coverage of conventional bands, including commercial aircraft, but no 800 MHz. Decent leather-like case. Slide-on 550 mAH NiCd battery pack.

BC200XLT (Uniden): 1987 vintage. Also sold as BC205XLT through Scanner World. Very good 200 channel version of BC100XLT portable scanner but includes 800 MHz band. 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Decent leather-like case. Slide-on NiCd battery pack.

BC210 (Electra): 1979 vintage. First Bearcat scanner with a keyboard and numeric display. LED readout. See US patents 4,092,594, granted 5/30/78 and 4,114,103, granted 9/12/78 for further insight.

BC220 (Electra): 1979 vintage. 20 channels. Reasonable number of features but 20 channels doesn't seem enough. Service Search for Marine and Aircraft. See US patent 4,270,217, granted May 26, 1981. LED readout. Good scanner, but tinny audio.

BC220XLT (Uniden): 1995 vintage. Very good 200 portable scanner which is a smaller successor to the BC200XLT. Includes 800 MHz band. 10 priority channels. Service Search, including WX. Up to 10 frequencies can be locked out during conventional search, 20 frequencies from Service Search. Unique feature tells whether a given frequency has already been memorized. 10.8 MHz and 450 kHz IFs, with images 21.6 MHz away. 4 cell BP-120 internal NiCd battery pack. Marketed as BC230XLT with two BP-120 battery packs and CRX-120 dual charger. See "The BC220XLT/BC230XLT Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, April 1996.

BC20/20 (Electra): 1981 vintage. Similar to BC220 but with 40 channels and different CPU circuitry. A maximum of 20 channels can be scanned at one time. Reasonable number of features. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC230XLT (Uniden): See BC220XLT.

BC235XLT TrunkTracker(Uniden): 1997 vintage. Portable with 300 channels in 10 banks. Can scan or search in conventional or trunked domains but not at the same time. Scans Motorola Type I, II, IIa 800 MHz trunked systems, but only one trunked system at a time. Programming Type I and IIa systems requires knowing the Fleet Map ahead of time or else using exhaustive trial and error. A query feature identifies duplicate memory channels. Very fast scan and search rates. Scans 64 channels/sec and skips empty channels. Service search. Data skip. Triple conversion, 254.4, 10.85, 0.45 MHz IFs. Excellent image rejection and intermod immunity. Fairly good audio. See "The Uniden Bearcat BC235XLT," by Bob Parnass, AJ9S, in Monitoring Times, July 1997 or an on-line version at http://www.grove-ent.com for a review which includes quantitative test results.

BC250 (Electra): 1976 vintage. 50 channel model, rich in features, but lacks aircraft band and 144-146 MHz. Search and Store feature extremely useful for finding federal frequencies. Clock. High frequency of repair. Power

transistors not heat sinked adequately, causing heat damage to surrounding components and circuit board. Failure of Q204 on the feature board known to cause odd display readings. Digital circuitry very sensitive to glitches caused by static and AC line spikes. Avoid 1978 or earlier vintage units. All BC250s use custom ICs (e.g., IC6, a divider chip, mfd. by Exar), which are now discontinued, so factory service is no longer available from Uniden.

BC260 (Electra): 1983 vintage. Super heavy duty metal cabinetry and lit controls, aimed at mobile use for firemen, police, etc. Few frills, only 16 channels, no aircraft, but generous coverage of federal bands omitted in the older Bearcat scanners. Good sensitivity. Lots of audio. Good internal construction. Backlit keyboard allows operation in the dark, but the keyboards on some units require high pressure to operate. Brightness control for display and keyboard, but multiplexor circuitry for vacuum fluorescent display produces audible whine which may be annoying in a quiet room. Backlighting may fail in some units due to poor contact on connector used to fasten light panel to front circuit board. 9 volt regulator transistor Q28 (TIP29) may fail, causing blank display while leaving audio intact. Method of connecting an external speaker is awkward.

BC300 (Electra): 1979 vintage. 50 channel top of the line scanner. Service Search feature contains 11 ROM banks of preprogrammed channels See US patent 4,270,217, granted May 26, 1981. Switching power supply failure noted in early units due to insufficient capacitance - component value was changed in newer units. Schematics show at least 100 components changed between earliest and later units. Preset squelch pot, mounted internally on circuit board, misadjusted in new units - adjustment usually required after burn-in period. Good sensitivity. Built in clock. I leave it on 24 hours a day. This is a favorite. See US patent 4,409,688, granted 11/11/83 for further insight.

BC350 (Electra): 1981 vintage. 50 channels in 5 banks. Includes aircraft. Used to be Bearcat's top of the line, overpriced scanner but never very popular. Dual use keyboard and display allowed 8 text characters to be associated with each channel, a feature clumsily implemented, and awkward to use. Units plagued with various hardware problems including bad memory ICs and short life power transformers. Firmware bugs without cures. The BC300 is a much better scanner than the BC350, and at a lower price.

BC760XLT (Uniden): Also sold as BC950XLT through Scanner World. Small, mobile scanner supplied with mounting bracket

and wall wart AC power supply. Some of the keys are backlit. 100 channels in 5 banks. Service search. Earlier version has Motorola type antenna jack and AA battery backup. Later version has BNC antenna jack and internal lithium battery. Can be fitted with optional CTCSS decoder. Hyper sensitive and easily overloaded by strong signals, especially when used with outdoor antenna in base applications. Conventional 10.8 MHz IF prone to images. Television audio heard in some places.

BC800XLT (Uniden): 1985 vintage. 40 channels in two banks. Covers 806-912 MHz, as well as of vhf, uhf, and aircraft bands. Receives 10 meter fm and all of 6 meters, as well as federal portions of vhf and uhf bands. Fewer birdies on vhf-lo band than other scanners. Scans and searches very fast. Clean, robust audio output. Extremely sensitive, but very prone to overload by strong signals when connected to outdoor antenna. Too much play (hysteresis) in squelch adjustment - can be improved by changing one resistor. Positive terminal in memory backup battery holder installed backwards in early units, allowing memory loss when scanner unplugged from AC outlet. Tunes in increments of 12.5 KHz on 800 MHz band, whereas cellular telephones are on 30 KHz channels. See "The Bearcat 800XLT ... an Owner's Report," by Bob Parnass, in Monitoring Times, March 1986.

BC860XLT (Uniden): 1995 vintage. 100 channel table top unit. Can lock out 10 channels during search. Good performer except for images. See "The Uniden Bearcat BC860XLT," by Bob Parnass, AJ9S, in Monitoring Times, May 1995.

BC890XLT (Uniden): Same as Radio Shack PRO-2036. Tuning knob. 200 channels, global delay. Count, AUX, and Auto Store features. Scans and searches fast. Accepts optional CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IF -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

BC895XLT TrunkTracker(Uniden): 1997 vintage. Base with 300 channels in 10 banks. Covers military air band, but other frequency coverage is limited compared with the BC9000XLT. Predetermined AM and NFM modes not selectable. Can scan or search in conventional or trunked domains but not at the same time. Scans Motorola Type I, II, IIa 800 MHz trunked systems, but only one trunked system at a time. Programming Type I and IIa systems requires knowing the Fleet Map ahead of time or else using exhaustive trial and error. Weather alert siren. Built-in CTCSS decoder and tone finder. A

query feature identifies duplicate memory channels. Test unit scans 85 channels/sec and skips empty channels. Triple conversion, 380.8 or 254.4, 10.85, and 0.45 MHz IFs. 800 MHz images in commercial and military air bands attenuated over 35 dB. For technical test results and a review, see "The Uniden Bearcat BC895XLT," by Bob Parnass, AJ9S, in Monitoring Times, December 1997.

BC9000XLT (Uniden): 1995 vintage. High quality base using up-conversion. 500 channels in twenty banks. Up to 250 channels can be programmed with alpha labels. Tuning knob. Selectable AM, NFM, WFM modes. Optional CTCSS decoder. Very fast scan and search. Can lock out 50 channels during search. Delay and attenuator independently programmable for each channel. Effective Auto Store feature stores unique frequencies. Good RF section, but not as robust as PRO-2004/5/6. IFs are 380.7/254.4, 58.075, 0.455 MHz. One urban user, located within a couple of blocks of several high power transmitters, reports severe desense problems. For a full review, see "The Uniden Bearcat BC9000XLT," by Bob Parnass, AJ9S, in Monitoring Times, March 1995. For tips and modification information, see my column in June 1996 Monitoring Times. See US patents 4,947,456, granted 8/7/90, 5,163,161, granted 11/10/92 and 5,212,817, granted 5/18/93 for further insights into fast scanning and searching implementation.

BC2500XLT (Uniden): 400 channel portable with tuning knob. Plagued by intermod and images. Early units drained batteries quickly even while turned off.

BC3000XLT (Uniden): 1995 vintage. Excellent 400 channel portable with 20 banks. Up conversion. Very fast scan, search, and intelligent Auto Store. Mode, attenuator, and delay settings programmable for each channel. 50 frequencies can be locked out during search. Larger speaker than PRO-26 produces better, crisper audio. NiCd pack provides about 5 hours between charges. See "The Uniden Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, April 1995 and "The Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, August 1995.

REGENCY

TMR series: First generation crystal scanners. Come in all varieties of band coverage. Models with both UHF and VHF bands must use separate antennas for each band (disadvantage in mobile installations, but can be overcome by connecting two front ends via a capacitor). Not sensitive enough to cover the entire 30 - 50 MHz range in a single model. There three versions of VHF-low band coverage depending on the

part of the 30 - 50 MHz band covered (LL, LM. and LH). TMR scanners use unsocketed incandescent bulbs for channel indicators which require periodic replacement. Easy to crystal: Radio Shack crystals work well. TMRs usually $2 and up at hamfests, often in poor condition. Don't pay more than $50, even if mint. Front ends must be tuned for selected portions within the bands for best sensitivity. Wide IF selectivity troublesome in urban/suburban areas. Primitive digital scanning circuitry may become confused at times. but power off/on restores sanity. Replace aging capacitors in the scanning circuits. You can find a TMR8H eight channel high band unit most often.

TME series: The base versions of the TMR models. Both the TME and TMR models share many common circuits but the base versions contain speakers mounted on the front panel. The most common TME model is the TME8 H/LM eight channel dual band scanner in a metal cabinet with wood coloring.

ACTR series: Replaced the Regency TMR units. By the time Regency made the ACTR units, they no longer offered different models for different parts of the 30 - 50 MHz band. Look for the later ACT series, e.g., ACTR-106 (10 channel tri band) or ACTR20/6 (20 channel tri band), used light emitting diodes for channel indicators instead of incandescent bulbs. Available in 1 to 20 channel models - most are multi band receivers. Somewhat wide selectivity. Not all that bad a deal if cheap.

ACTE series: The base versions of the ACTR series. The ACTE and ACTR circuitry is similar, although the base versions contain speakers mounted on the front panel. The most common ACTE model is the ACTE8 H/L eight channel dual band scanner in a black metal cabinet.

WHAMO-10: Regency's first synthesized scanner. Appearance more like a crystal scanner, with a single LED per channel. User has to break off teeth on a metal 'comb' for each channel according to a code book. See US patent 4,057,760, granted 11/8/77. External frequency control unit DFS-5K optional. UHF VCO reference oscillator drifts on some units. Soldered sheet metal shields around some circuitry make access to some components difficult for servicing. Comb sockets prone to bad connections after moderate use. Not recommended due to maintenance difficulties.

K500: Nice wood-like cabinet. 40 channel model with every feature Regency could dream of in one scanner, except aircraft band. Idle tone bypass feature for mobile phone stations works about 50% of the time. Weather alert feature. Service Search in several banks. Search and Store facility not implemented as well as BC250, but better than none.

Built in clock when radio off or in manual mode. Can be programmed out of band. Reasonable performance, but sensitivity could be better. Spring contacts on membrane keyboard may need soldering after prolonged use.

K100: Bare bones version of the K500. 10 channels, no priority feature. Same wood-like cabinet and reasonable performance as K500. Spring contacts on membrane keyboard may need soldering after prolonged use.

M400: 30 channel replacement for K500. Service Search, but no aircraft. Easily programmable out of band. Built in clock when radio off or in manual mode. Backlit keyboard good for night viewing and mobile use but generates RFI into nearby SW receivers. A favorite.

MX3000: 30 channel replacement for M400, but basic features only. Nice lit keyboard, but may cause RFI into nearby SW receivers. Easily programmable out of band, but no aircraft. All 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Good first scanner.

M100: 10 channel unit. Same as MX3000 except different color and fewer channels. Nicely lit keyboard, but may cause RFI into nearby SW receivers.

HX1000: Good, fairly rugged, 30 channel handheld synthesized unit. Generous out of band coverage but no AM aircraft coverage. Built by Azden. Very sensitive on UHF, but annoying audio hiss leaks through speaker when squelched. Belt clip chintzy, but can be directly replaced with better clip from Kenwood TR2600A. Like the MX3000, all 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Low discount price makes this best choice for programmable portable.

HX650/H604: 6 channel crystal portable. Likely made by Sanyo. Same as Fannon and Bearcat Thin Scan units, (except that Bearcat has 10.8 MHz IF frequency, and is harder to get crystals for), but scans faster. Small size and common crystals (available at Radio Shack), make this 1st choice for bare bones portable scanner.

Z60: base/mobile sporting 60 channels, but 10 of them are for FM broadcast only. Built in alarm clock, priority, and memory which requires no battery backup. Covers 30 - 50, 88 -108, 118-136, 144-174, 440-512 MHz. Notice that it's not spec'd to cover some important federal bands: 136 - 144 and 406 - 440.

RCA

RP-6150: 1997 vintage. No frills, good performing portable. 200 channels in 10 banks. No military aircraft frequency coverage. Triple conversion and a flexible battery arrangement. Lacks duplicate channel detection, search skip, and empty channel lockout features of newer designs. Our sample isn't super sensitive at 470 - 512 MHz and has some intermod around the VHF railroad channels but is generally more resistant to image problems than the BC230XLT. For technical test results and a review, see "The RCA RP-6150 Portable," by Bob Parnass, AJ9S, in Monitoring Times, April 1998.

RELM

HS200: 1996 vintage. Very good 200 channel portable. 10 banks. Built-in CTCSS and DCS decoder. Lighted keypad. Duplicate channel detection. 100 frequencies can be locked out from search. Very good audio and strong front end. Excellent internal shielding. Global rescan delay. Covers CB. Fixed modes and step sizes. IFs are 280.2 and 0.45 MHz, and perhaps one in between. See "The RELM HS-200 Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, April 1997, for a review which includes quantitative test results.

MS200: 1998 vintage. Made in USA. 200 channel mobile with alpha labels. CTCSS and DCS decoding squelch. Programmable via PC using supplied software. Low contrast, LCD display. Keypad backlit for night programming. Rear panel tape audio jack. Test unit had lots of intermod on VHF-high band. IFs are 280 and 0.45 MHz. See "The RELM MS-200 Scanner," by Bob Parnass, AJ9S, in Monitoring Times, March 1998, for a review which includes quantitative test results.

RADIO SHACK

PRO-24: 1983 vintage. Only 4 channels in this crystal controlled portable. Covers the three basic bands, but no aircraft. Easy to obtain batteries and crystals. Characteristic Radio Shack squelch problem, fixable by changing one resistor. All-plastic case larger than Bearcat Thin Scan and clones. See "The Radio Shack PRO-24 Scanner," by Bob Parnass, excerpted in the "Technical Topics" column, RCMA Newsletter, February 1984.

PRO-26: 1995 vintage. (Not to be confused with a simple 1985 crystal controlled portable bearing the same model number.) Very good portable made by for Radio Shack by Uniden. 200 channels, very fast scan/search. Good display. Covers all TV channels, but spectrum adjacent to cellular phone band is censored which prevents monitoring parts of some trunked systems (e.g., IL State Police district 4). Up to 50 frequencies can be skipped during search. Limited image

rejection causes 929 MHz paging interference in 170 MHz range. IFs are 380.7/254.4, 58.075, and 5.5/0.455 MHz. Audio suffers from small speaker. See "The Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, August 1995.

PRO-30: 16 channel programmable portable with aircraft band. Good frequency coverage. Extra controls on top allow control of SCAN, MANUAL, and PRIORITY functions while worn on belt. Good belt clip. Low audio output. Plastic case prone to break at BNC antenna connector under severe use, vs. metal frame in Regency HX1000. High price, no discounts or sales yet. I had 6 or 7 PRO30s, having to return them several times during the 1 year warranty, although other owners have had little or no trouble. Troubles included oscillation in IF stage, no UHF band reception, case broken around base of antenna connector, etc.

PRO-34: Portable scanner with 200 channels and 800 MHz coverage. Ten "monitor" channels. Operates from AA cells. Slow scanning, low audio output, and chintzy plastic case detract from an otherwise good performance. No decent leather case available from Radio Shack. If you need a portable with 800 MHz, get a Bearcat 200XLT. If you can't get a 200XLT, get a PRO-34.

PRO-43: Very good portable made by GRE. First Radio Shack portable with up conversion, and 222 MHz ham and 225 - 400 MHz military air band coverage. 200 channels, single search range. Small, convenient size. Muffled audio. Speakers in early units known to fail and more powerful speakers were used in later units. 800 MHz band coverage fully restorable in early units by removing diode. Uses same 6 cell battery tray as other high end GRE portables. Subject to interference in 160 - 162 MHz range. IF frequencies are specified at 608.005 - 611.2 MHz, 48.5 MHz, and 455 kHz.

PRO-52: 8 channel VHF-Lo/Hi base unit. No UHF band or provision for mobile operation. Good little scanner despite limited frequency coverage and Spartan lack of frills. Crisp squelch action and good audio, helped by a front mounted, vertical speaker.

PRO-60: 1995 vintage. Very good portable made by GRE. 200 channels, single search range. Similar features and same IFs as the PRO-43 it replaced but the PRO-60 has wider frequency coverage and crisper audio. Covers 75 MHz and commercial FM broadcast bands. Improved Direct search can be stepped manually in single steps. Uses same 6 cell battery tray as other high end GRE portables. Railfans take note -- the PRO-60 and PRO-43 are subject to interference in 160 - 162 MHz range. Draws 100 mA while scanning. See "The

Radio Shack PRO-60 Portable," by Bob Parnass, AJ9S, in Monitoring Times, September 1995.

PRO-62: 1994 vintage. Good portable 200 channel scanner using up conversion. Similar to PRO-43 but no military air band, different upper frequency limit, and slightly different IFs. Selectable AM/NFM modes. Better intermod immunity than PRO-43. See "The Radio Shack PRO-62," by Bob Parnass, AJ9S, in Monitoring Times, February 1995.

PRO-64: 1997 vintage. Good portable 400 channel scanner using up conversion. Replaces PRO-62 and has many more features. Selectable AM/NFM modes but fixed step sizes. 10 search banks which can be cascaded. Auto store saves unique frequencies found during a search. Frequencies can be loaded using a computer but optional interface kit not yet available. Can recharge Radio Shack's optional, monolithic NiCd pack, but not AA cells within the scanner. IFs are 257.5, 21.4, and 0.455 MHz. See "The Radio Shack PRO-64," by Bob Parnass, AJ9S, in Monitoring Times, August 1997, for a review which includes quantitative test results.

PRO-67: 1997 vintage. Good portable 200 channel scanner using up conversion. Replaces PRO-51 and has better image rejection and super fast scanning. Service Search lacks police frequencies. Fixed AM/NFM modes and step sizes. Can lock out up to 20 frequencies during a search. Can recharge AA cells within the scanner. Frequencies adjacent to the cellular phone bands censored so our PRO-67 will not receive 868.9625 or 823.9625 MHz. Intermediate Frequencies are 254.4, 10.85, and 0.45 MHz. See "The Radio Shack PRO-67," by Bob Parnass, AJ9S, in Monitoring Times, October 1997, for a review which includes quantitative test results.

PRO-91: 1998 vintage. Portable made by Uniden for Radio Shack. 150 channels in 5 banks. Can selectively follow conversations in 800 MHz Motorola trunked radio systems. Censors 823.975 - 823.95 and 894.0125 - 896.1 MHz covered by the BC235XLT. Powered by four individual AA alkaline or NiCd batteries. Power save feature. Program key. One priority channel/bank. One search bank. Direct search. Service search omits many police freqs (inc. 460 - 460.5 MHz). While connected to an outdoor antenna, our PRO-91 experiences intermodulation interference in the 161 MHz range from a paging transmitter on 158.1 MHz. IFs near 380.7, 10.85 and 0.450 MHz. See PRO-91 review by Bob Parnass, in Monitoring Times, December 1998, for review with quantitative test results.

PRO-2001: Early, single bank 16 channel programmable. Reasonable coverage of the 3 traditional bands, minus aircraft band. LED digital display as well as an LED per

channel. Mechanical lockout switch for each channel. Delay is either on or off for all channels at a time. High synthesizer noise level. Troublesome plated through holes on digital board in some units renders radio virtually unfixable. Could never get mine to work more than a few days in a row; always another bad connection. Some owners have no trouble.

PRO-2003: Radio Shack's 1986 top of line. 50 channels + 10 FM commercial broadcast band channels. Includes aircraft. Good frequency coverage and functionality, but at a high price. Poor human engineering: difficult to read keyboard makes the PRO-2003 hard to operate unless in a well lit room. Keyboard label coloring improved on newer units. Rather slow scan rate and high price. Although there are provisions for 12VDC operation, the cabinet shape and lack of mounting bracket makes mobile operation impractical. Scan rate only 8 channels/sec vs. 15/sec in Regency and Bearcat. Causes RFI: Plastic case permits scanner to radiate signals into nearby receivers.

PRO-2004: 1986 vintage. Top of the line, wide band scanner for 1987. After a diode is cut, enjoy continuous coverage from 25-520 and 760-1300 MHz, AM, NBFM, and WBFM. Has 300 channels in 10 banks of 30, backed up by conventional 9 volt alkaline battery. Any channel can be designated the priority channel. Scans and searches fast. Lots of well designed features, like 10 pairs of search limits, Lockout Review, default search increment and emission mode. Sound Squelch allows skipping dead carriers during search or scan. Metal cabinet, good internal construction and shielding, but no mobile mounting bracket or DC power cord. Soft touch membrane keyboard. Good sensitivity and selectivity. Very good radio. See "Product Review: The Radio Shack PRO-2004 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, February 1987, and Monitoring Times, March 1987.

PRO-2005: 1989 vintage. Essentially a size reduced PRO-2004 with surface mount components and 400 channels. Some people think the small knobs, smaller display, and plastic cabinet are a setback from the 2004. The smaller size, real rubber keyboard, and vertical front panel make it easer to use mobile, although the keyboard is not backlit. More sensitive than the PRO-2004 but 800 MHz signals leak through into the commercial aero band. Highly recommended. See "Product Review: The Radio Shack PRO-2005 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, June 1989, and RCMA Journal, August 1989.

PRO-2006: 1990 vintage. Essentially the same as PRO-2005 but scans faster. Probably the best scanner made to date.

Highly recommended. See "The Realistic PRO-2006," by Bob Parnass, AJ9S, in Monitoring Times, October 1990.

PRO-2021: Base/mobile scanner. 200 channels in 10 banks, LCD display and raised rubber keys. Lots of memory but scans too slowly and lacks 800 MHz. Ten "monitor" channels. Radio Shack seemed to have an overstock of 2021s as they were on sale for such a long time. Close out price dipped to about $200, which made it a nice scanner for beginners.

PRO-2022: Base/mobile scanner. Like the PRO-2021 but includes the 800 MHz band. Somewhat prone to intermod in the 460 MHz range. Cellular images throughout the 847.6 - 869 MHz range. See September 1996 Monitoring Times for modifications.

PRO-2035: 1995 vintage wide coverage base made by GRE. 1,000 channels, but cumbersome 100 channel bank size. Tuning knob. Broader IF selectivity than PRO-2006. Poor dynamic range. 10 linkable search banks. Dumb Auto Store feature stores the same frequencies over and over. Wastes time scanning empty channels. See "The Radio Shack PRO-2035 - How Does It Compare With the PRO-2006?," by Bob Parnass, AJ9S, in Monitoring Times, January 1995.

PRO-2036: Same as Uniden/Bearcat BC890XLT. Tuning knob. 200 channels, global delay. Scans and searches fast. Count, AUX, and Auto Store features. Accepts optional CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IFs -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

PRO-2037: 1994 vintage. Triple conversion all plastic base scanner made by GRE. Home version of the PRO-62 portable but with more intermod. 200 channels in 10 banks, one search bank, selectable AM and FM. Uses up conversion circuitry but inadequate front end filtering still allows images, though not as bad as in 10.7 or 10.8 MHz IF circuits. Crisp, respectable audio given the top mounted speaker. See "The Radio Shack PRO-2037," by Bob Parnass, in July 1995 Monitoring Times.

PRO-2040: late 1995 vintage 100 channel base made by Uniden. Fair performance, but minimal image rejection. Local oscillator harmonics account for spurious responses, e.g., reception of cellular telephone calls in the 460 MHz UHF-high band. Scans over 40 channels/sec. Can lock out up to 50 channels from search. "Soft" on/off power switching via keypad. See "The Radio Shack PRO-2040," by Bob Parnass, AJ9S, in Monitoring Times, December 1995.

PRO-2042: 1996 version of the wide coverage PRO-2035 base with improved firmware and amber display. Made by GRE. 1,000 channels, but cumbersome 100 channel bank size. Tuning knob. NFM selectivity is still a problem but improved over PRO-2035. 10 linkable search banks. Smart Auto Store feature stores the unique frequencies. Can lock out up to 200 frequencies from search. Query facility indicates if and in what channel a frequency is programmed. Scan skips over empty channels automatically. Can sort memories by frequency within a given bank. IFs are 609 - 612, 58.05, and 10.7/0.455 MHz. Broader IF selectivity than PRO-2006. Overall, a top grade scanner and second only to Uniden/Bearcat BC9000XLT. See "The Radio Shack PRO-2042," by Bob Parnass, AJ9S, in Monitoring Times, February 1996.

PRO-2045: 1996 vintage. Very good 200 channel base/mobile made for Radio Shack by Uniden. Tuning/channel selector knob. 10 banks, selectable attenuator, and rescan delay. CTCSS-capable with optional board. Great Auto Store. Weather alert. Scans and searches fast. Can lock out 50 frequencies during search. Step sizes fixed but AM and NFM modes are selectable. IFs are 380.7, 10.7, and 0.455 MHz. Images on VHF-high band despite high 1st IF. Some intermod on review unit. See "The Radio Shack PRO-2045," by Bob Parnass, AJ9S, in Monitoring Times, February 1997, for a review which includes quantitative test results.

PRO-2046: 1996 vintage 100 channel mobile made by Uniden with fairly good performance. Descendent of the BC760XLT but no CTCSS option available. Ten banks of ten channels. Scans memory at about 34 channels/sec. Service search, direct search, and band search. Preset search limits by band and user cannot program the search limits. Image rejection is minimal, as one would expect from a scanner with IFs of 10.85 and 0.450 MHz. 10 Monitor memory channels. Can lock out up to 20 channels from a search. See "The Radio Shack PRO-2046," by Bob Parnass, AJ9S, in Monitoring Times, October 1996, for a review which includes quantitative test results.

PRO-2050: 1998 vintage 300 channel Motorola trunk system tracking base made by Uniden. Tight front end. Excellent performance. Chassis-less, plastic construction. Squelch and volume knobs too close and Manual key is hard to find. IFs are 380.7 (approx.), 10.85, and 0.45 MHz. AM and NFM modes are factory set and not selectable. 300 channels in 10 banks and a 2 second rescan delay may be programmed on a per channel basis. Query feature identifies duplicate memory channels. Our PRO-2050 scans at 78 channels/sec., skipping over empty channels. 10 priority channels. Up to 50 frequencies may be locked out from limit search. A single pair of limits may be programmed for a limit search.

No Direct key or direct search facility. Factory preprogrammed frequencies for police, fire/emergency, commercial air, public service, and weather, but not marine. See May 1998 Monitoring Times for a review which includes quantitative test results.

SONY

SC1PC: 1998 vintage. Good RF and audio performance. Covers 25 - 1300 MHz, minus cellular phone. Selectable step size and mode. Computer control and downloading with software and PC cable provided. Powered by ordinary AA batteries. Provided CDROM includes both the scanner control program and the multi million record PerCon FCC license database. 10 banks ("pages" in SONY parlance) of 30 channels each. Per-channel 2 second rescan delay. Unlike the ICOM IC-R10, you can scan any combination of memory banks. You can lock out ("skip") memory channels from scanning. The frequency stored in a skipped channel will also be skipped during searches. One priority channel checked every 5 seconds. SONY's limit search is restricted to one pair of search limits, though computer control expands this to 20 linkable pairs. Band search lets you search through 17 bands programmed at the factory. Service search. A cache, termed Intelligent Memory, stores the last 10 unique frequencies that were active for longer than 5 seconds each. IFs (in MHz) are 600 (below 370 MHz), 232.5 (above 370 MHz), 45.0, and 0.455. For a service manual, call SONY at (800)488-7669, and press 3. See "The SONY SC1PC," by Bob Parnass, AJ9S, in Monitoring Times, August 1998, for a review which includes quantitative test results.

SPORTYS

JD-100: 1997 vintage. Limited 20 channel scanner which covers civil and military air bands only. Good audio. Large display shows frequency only out to 2 digits. Slow scanning and odd keystroke sequences. No key press confirmation beep. Cannot lock out channels from memory scan. Powered by AA batteries. Battery saver circuit. See "Sportys JD-100 Air Scan," by Bob Parnass, AJ9S, in Monitoring Times, November 1997.

CRAIG (division of PIONEER)

4530: Japanese 10 channel crystal controlled 3 band unit. Also available under Plectron name but in different cabinet. No aircraft band. Deluxe features like priority, trimmer capacitors for netting each channel, front panel speaker, and rugged metal cabinet make this unit a winner. Channel lockout slide switches have finite life. Replacing burned out incandescent channel lamps not fun. Grab a 4530 if you

find one in good condition.

SONAR

Sonar made several crystal controlled scanners and channelized monitor receivers which shared the same RF circuitry. Each radio was housed in the same size metal case and worked on both 120 VAC and 12 VDC. The models differed in the number of channels, the band coverage, and whether individual channels could be locked out.

Although they used a 10.7 MHz first IF, Sonar radios require parallel resonant crystals different from the common series resonant crystals used in Regency and Radio Shack scanners. Some Radio Shack crystals will work in Sonar units, but more often they oscillate a few kHz off frequency and are unsuitable unless changes are made to the oscillator circuitry. Therefore, beginners should avoid these radios. Typical Sonar squelch has long time constant causing a long noise burst at the end of each transmission.

FR-104, FR-105: 6 channel monitor receivers covering 25 - 50 MHz or 150 - 175 MHz. Manual channel selection, i.e., no scanning. Early models are identified by an 11 pin connector on the rear and they could be used with an optional NiCd battery pack and charger which bolted to the rear panel. Later models used Cinch Jones connectors with flat contacts. Optional tone decoder board.

FR-2512, FR-2513: 24 channel versions of the FR-104 and FR-105 monitor receivers. Manual channel selection, i.e., no scanning.

FR-2514, FR-2515: 8 channel scanners. Channel 1 priority. Recommend you avoid these models as there is no way to lockout a channel from the scan sequence.

FR-2526, FR-2526, FR-2528: 10 channel scanners covering various combinations of 3 bands. Each channel could be locked out. Channel 1 priority.

Sonar Model	#chan- nels	VHF low	VHF high	UHF scans?	lock- outs?
FR104	6	X			no
FR105	6	X			no
FR2512	24	X			no
FR2513	24	X			no
FR2514	8	X		yes	no
FR2515	8	X		yes	no
FR2516	10	X		yes	yes
FR2517	10	X		yes	yes
FR2525	10	X		yes	yes

FR2526 10 X X yes yes
FR2527 10 X X yes yes
FR2528 10 X X yes yes

Table 1. Summary of Sonar base/mobile monitor and scanner receivers

TENNELEC

Manufactured the first synthesized scanners. See US patents 3,961,261 and 3,962,644, granted 6/1/76 and 6/8/76 respectively. Company went out of business several years ago. Schematics and parts difficult to obtain. Radios reputed to be poor performers. Got my MS-2 and MCP-1 basket cases for free and sometimes regret taking them. Not worth fixing unless you have access to DTL/RTL chips and circuit diagrams.

Plectron and Motorola Alert Monitor Receivers

In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their transistor Plectron and Motorola Alert monitor receivers. They have now been replaced by portable pagers, and are often available at hamfests in the $5 - $25 range. Since many are in rough condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola Alert crystal controlled receivers are excellent for dedicated monitoring of local frequencies -- a task for which you wouldn't want to tie up your 400 channel programmable scanner. These radios are fixed channel units and do not scan. They can be powered form 117VAC or 12VDC with the proper mobile cord.

The audio quality on a Plectron P1 or 700 series is far better than any consumer grade scanner and the sensitivity and intermod immunity is outstanding if aligned properly. Better image rejection than most scanners (see article by Bob Parnass in Monitoring Times, January 1996 for comparison). The Plectron 500 series is less desirable. The Motorola Alert monitors are pretty good, although the audio lacks bass.

No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz band, and there were versions optimized for each portion of the band. There were different "split" models to cover segments of VHF-hi band, too. Although UHF versions were made, they are somewhat rare.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies

far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency. Too, the P1 and R700 require different crystals.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Repair service for the Plectron P1 and R700 models is offered by:

Woodson Electronics
Plectron Place
P.O. Box 960
Imboden, Arkansas 72434

telephone 1-(501)869-7985

Some replacement parts are currently available from Federal Signal in University Park, IL, phone (800)524-3021. For more information, see "Add a Crystal Receiver to Your Arsenal," by Bob Parnass, January 1996 Monitoring Times.

Custom Color Map & Report
of Transmitter Sites Near You

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country since 1994, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a beautiful 11" by 17" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc. See http://www.megsinet.com/~parnass for a sample.

RadioMap has been advertised monthly in Monitoring Times magazine since 1995. The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and

wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $10.00, the deluxe report includes and extra index sorted by frequency and a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $39.95 for deluxe RadioMap report with histogram and additional index by frequency. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

How to Obtain Copies of Patents

Printed copies of US patents may be purchased for $3 each, but you must know the patent number. Credit card orders are taken over the telephone by the Assistant Commissioner for Patents at (703)305-4350. Alternatively, you can mail a check or money order, made payable to "The Assistant Commissioner for Patents" to

The Assistant Commissioner for Patents
Washington, DC 20231

For more information about the US Patent and Trademark Office, call their automated information message system toll-free at (800)786-9199.

There are various patent servers on the world wide web, including Delphion's server:

Hehehehehehehe!

Reminds me of the Seinfield episode with the car that they could not get the stink out of.

OK everybody, here's what I found:

The seven convicts, including two murderers, escaped from a prison in Kenedy, Texas on Dec. 14th. Two days later, they are believed to have been the ones that robbed a Houston, Texas area Radio Shack, stealing scanners and various two-way radios. On Dec. 24, they held up a Oshmans Sporting Goods store in Irving, Texas. One of the police officers responding to the alarm at the store was shot and killed by the escapees while fleeing the scene. This officer was Aubrey W. Hawkins, 29, callsign KC5USI. The escapees are still believed to be in the Dallas area.

From the ARRL Web Letter:

* Slain Texas police officer was amateur: An Irving, Texas, police officer shot and killed after answering a robbery call was an Amateur Radio operator. Aubrey W. Hawkins, KC5USI, a Technician licensee, died on Christmas Eve while responding a robbery-in-progress call. He was 29. Hawkins had been a police officer in Irving since October 1999. Police said this week that seven escaped prison inmates wanted in connection with the killing remain at large. An Eagle Scout, Hawkins was active in RACES and SKYWARN. Marv Kontak, N5MK, reports that more than 2000 attended Hawkins' funeral December 28. Hawkins' wife and a nine-year-old son survive.--Marv Kontak, N5MK

You really haven't made the slightest effort to learn this for yourself, have you? Go to the web (or even a hardcopy encyclopedia in your library) and start reading about amateur radio. Or read the FAQs that Bob Parnass has worked so hard on and has just posted here. Or buy a copy of Police Call 2001 at Radio Shack. Or even type the same words you entered above into a box at www.askjeeves.com. Then come back when you have some real questions, and we can give you some real answers.

>for $350.00. Is it to much, is this a good deal, and is it a good unit?
>Thanks
>for any help, JT

Here's my opinion of the good and bad features of the Yaesu FRG 9600. I own two of these receivers, and have had the first one for three years now.

GOOD: Receiver has full 800 MHz coverage and all mode reception, which allows one to receive 2 meter SSB signals
and wide FM weather satellite signals. Good weak signal sensitivity. When used with the optional video board and a monitor, the FRG 9600 can receive amateur fast scan TV as well as over the air TV broadcasts. The 9600 is a good receiver if you like to monitor the military aircraft band.

BAD: Scan speed is very slow. The FRG 9600 can scan only one bank of 10 channels at a time. It's really more of a communications receiver than a scanner. Receiver is prone to overload when connected to a preamp, or, in some areas, an outdoor antenna.

$350.00 is not a bad price for a used FRG 9600 in good condition. I paid $375.00 for the first 9600 I bought, and $285.00 for my second rig. My first 9600 was worth a bit more since it had the video board installed.
Since the radio can receive the cellular frequencies, part of the $350.00 price tag is a premium for full 800 MHz coverage. All in all, the FRG 9600 is a reasonably good receiver considering its age, but for the money an Icom IC-R10 or Yupiteru MVT-7100 would probably be a better choice.

73,
David

This past weekend we were on I-64 in northern Kentucky, lite snow and all westbound traffic stopped due to a wreck at about milepost 33. I had PRO 51 a scanner with, programmed for a few Missouri HP freqs and tried a band scan in that area 40-42 mhz. Never came up with any traffic.

Has KY gone to 800 mhz sys? Anyone know of an online list of the State Highway Patrol freqs? I did find some local sheriff dept traffic in the 154/155 mhz band but peripheral to stuff the HP would have been handling.

Depending on your location, all modes/bands are filled with traffic of different sorts.

As even a few miles can change what you hear on the air, you will need to provide a specific location.

Each is different: USB/LSB/SSB, what are you looking for?

Further research can yeild tons of information.

Although not in the NH area I can relate some basic tips.

Furhter information is published on a regular basis here in the Newsgroup that relate to new user information.

1- Get a log and keep track of frequencies

2- Start small and work up as your interest grows, almost any scanner with a stock antenna will provide useful for the new user.

3- Make use off frequency list sites for what you want to hear:

http://expage.com/pbscanner

http://www.perconcorp.com/datafinder/index.html

http://home.austin.rr.com/tigwelder/scaner.html

4- Take your time, sometimes a channel may be quiet for days, weeks... before you hear something exciting, remember sometimes there is nothing going on.

5- Seek out other scanners near you for region specific information as it relates to new frequencies, antennas, dx'ing and such, as everywhere is different.

6- Look for some newer publications about scanners and ham radio to learn more.

Browse around and you will find tons of help

best,

Happy New Years

You will need equipment that transmits on the frequency you want.

Depending on the frequency will dictate how, where and if you can do this:

More information will be required for further information.

BTW: Unless you are licensed to use the frequency or the frequency use is license free with accepted equipment, it is a big NO NO, not only illegal but a life/safety issue, even if done as a prank.

I understand that there is a small battery inside, depending on age, quality and other factors these memory batteries can and do fail.

I would suggest looking into a qualified repair shop or HAM to look into the radio, test the battery and replace if needed.

From most electronic experience I have, almost every "memory battery" is a bit larger than a watch battery and is often held in with some soldder.

You may also try Radio Shack service for assistance as it is there radio and they may know a bit more.

Best,

How true indeed, as in these past weeks, the FEDS have asked hams to avoid use of some frequencies which they have a 2ndary use right to...this is due to the severe weather problems and emergency coordination/como needed in lue of phones which are down in some areas.

There are internet-connected computers @ the public
libraries... but I doubt that a prison escapee on the run
would duck into a public library, sign in (show ID), then
use the allotted 30-minute period to read some newsgroups,
for that matter. They'd probably just check out some good
ol' fashined porn. :)

Interesting, I have noticed the same thing and heard reports from others in the area. Typical MA Army National Guard aviation is in the 6 meter ham band or VHF "low band".

KSP has gone Astro:(They are still on UHF in the 453 and 460 range
and are NOT trunked but all you hear is digital trash. You may still
hear the mobile repeaters on 154.665 in the clear.

both are radioshack antenna rotors and control boxs

(1) archer 15-1225 has rotating dial, takes 3 conductor low voltage
wire, mast fits into the rotator.

(1) superior 15-1220 has 2 red lights for direction turning
left or right. takes 5 conductor low voltage cable, mast fits
through the rotator.

These are used but still work great
i will ship them for free.
$30.00US each (advance International Postal Check"

For sale: Optocom, excellent condition (cellular blocked).
No scratches or marks, with original docs, software, box,
etc.
$350 plus shipping.

Uniden MR8100. Works great, has a few scratches, nothing
is broken or missing. With mobile bracket and programming
software. No manual, but you don't need one, it's easy to
operate. I'll throw in a nice mobile speaker.
$150 plus shipping.

Thanks,
Jon - kf7yn

Thats no big deal and does not require a fcc test.
You just have to apply for the lic. and I think some hard cash.
But to some people, that might land them in a hospital.
Good luck and a very merry happy sales year to all of you.

Hi. I have a GRE Super Converter II on the way to allow reception of the cell phone range.. I was wondering... Are there other converters out there to allow the reception of other frequencies not covered by scanners.... IE I'd like the TV audio freqs but its just above my range limit of 54. also I would like military which isnt in my pro-90, as well as others....

Are there other converters out there, or can I make my own? Anyone have any info on this instead of buying a whole new scanner?

237. Recommend good mobile ant. for 800Mhz??

Hiya,

I have tried my new 780 in the car a few times and I'm not happy with the antenna performance on trunked systems. I want a good antenna for this radio...the radio will be solely used for 800Mhz reception. Can anyone recommend a GOOD antenna?? Preferably a thru-the-glass antenna as I am running 'low profile'. Perhaps a gain cellphone antenna?

Anyone?

If you have time to cancel the order, do it fast! This is only going to let you hear cellular calls that your scanner is already able to listen to without any modifications or converters! All 800Mhz scanners can pick up cellular above the cut out bands.

And since you can only hear one side of the conversation these days, and listen only as long as the car is in your near by cell site, this is an extreme waste of money!

Use the money to buy a touchtone decoder display and listen to cordless phones!

You should have been listening to 453.350, or 450, or 550. Most KSP uses 453.xxx and 453.300 car to car, mobile extender 154.665 (or is it 155.665, I can't never get this one straight...). They don't use low band any longer, or vhf for that matter unless it is an interservice freq. They are experimenting with an Astro system in and around Frankfort/Richmond, digital. KY has 800 megs licensed but not a peep here in the East end on I-64 at marker 191.

I was in CIncy listening that weekend, lots of highway activity....

What this means, mhawra@hotmail.com, is that unless you are a party to the communications you posted [which I assess to be highly unlikely], your little "log" is in blatant violation of Canadian law.

See http://canada.justice.gc.ca/en/laws/R-2/index.html; something you should have checked *before* you bought that radio of yours.

Do feel free to start hoping that there isn't a Quebec prosecutor with some idle CPU cycles on his hands ... frankly, though, I hope you get nailed to the wall, as this sort of behaviour reflects badly on the rest of us scanning/receiving/amateur signals intelligence enthusiasts.

You can convert anything to anything by heterodyning (mixing) a frequency with another. When you mix two different signals, you get the original two and a sum and a difference. If you mix 50 MHz with 125 MHz, you get four frequencies out: 50 MHz, 125 MHz, 175 MHz and 75 MHz. You just have to mix them in a non-linear fashion and make sure you don't radiate the signals you produce. It would be very easy to mess with another radio service. You can find sources on the net or your library.

Try looking at ham books or web sites for specifics.

Listen from about 870 to 890 (that should be higher than the cut out band) I have heard cellular phones in this range on every 800 Mhz scanner made. New or old. And on every Ham radio that has receive in this band. If you have a cell site nearby, you will hear something. (in between all those noisy pager signals)

257. Openness Headline Update 010301

Newsgroup: rec.radio.scanner
Date: 2001-01-04 03:50:19 UTC
From: David Pinero <davidpin@pobox.com>
Message-ID: <fes75tsrp3so2sm1lbapke9irlterck7a5@4ax.com>
Source record: 73003
Cross-posted to: alt.law-enforcement,alt.radio.scanner,rec.radio.scanner,alt.radio.broadcasting.open

The following information was posted today at the Openness website located at www.openness.org. The site is an advocate stage for the advancement of open public safety communication systems. If you are concerned about losing access to public safety communications in your community, make yourself a part of this campaign today. Newstips, links, and other information can be mailed directly to davidpin@pobox.com:

MAYSVILLE TO GET DIRECT ACCESS TO WEATHER RADIO

Cities all over the country have weather radios ... why can't there be public safety radios that work on the same principle? Such radios would use a dedicated frequency or series of frequencies, like weather radios, and either openly broadcast simulcasts of public safety communication - or merely alert information which would use tones to activate special receivers in specific neighborhoods or zip codes. Along the same lines, take notice of such online utilities for 24-hour internet connections like Weatherbug (http://www.weatherbug.com), or MSNBC's News Alert. Programs like these sit in your system tray and "activate" whenever an alert is issued. Again, why not the same for public safety information? We can dream. :)

(Note that extensive URL address may break in some readers)

http://www.kentuckyconnect.com/heraldleader/news/010301/statedocs/03maysville-final.htm

WHO MONITORS THE WATCHDOGS?

It's fringe, but you know what: Openness.org predicts the rise of such groups (which this article says have been around forever in one form or other). As communities begin to successfully and without compromise close access to public safety communication, not to mention systematically outlaw videotaping and public witnessing, there may very well be the evolution of "guerrilla journalists". The guys in this story wear orange t-shirts and are more concerned about police brutality than closed systems. In my fanciful prediction on the matter 2 years ago I suggested they would wind up wearing yellow raincoats and be more obsessed with public closure. Fortunately for everyone this particular police department is apathetic to the group to downright positive towards them. The report reads "Tempe police Sgt. Randy Fougner said his department welcomes the scrutiny, and echoes the sentiments of many other officers about Copwatch." Also, Tempe currently openly broadcasts since the members of this group use scanners. Not too shabby.

Hi there guys,
Just wondering if someone could give me a heads up on a beginners short wave radio?
I am new, don't have a lot of money but am interested in short wave radio, I do not need anything to fancy, so just wondering what you might recommend in a radio either a new on or a few years old, I would preffer a desk top or base model but portable would be ok as well.Digital display?,I have read on the net but its a little confusing and overwelming.
Yaesu?...Kenwood?.Radio Shack?
Thanks in advance for any help or advice you may have.
Russ

The new radios have the advantage of digital displays. They generally lack tuned front ends, though. They are susceptable to lots of interference. Older radios were organized into bands. They each had tuning circuits that rejected other signals. You can buy a digital radio and also a tuneable preselector (MFJ has them for $69) and be pretty well off.
Several radios under $200 to choose from. MFJ has a black box radio that runs through your computer for about that much. Jim

267. 155.535 & Mt. Carmel Hospital

Newsgroup: rec.radio.scanner
Date: 2001-01-04 06:46:54 UTC
From: "M. Schneider" <markinokla@juno.com>
Message-ID: <R_U46.368$7k5.2091@newsfeed.slurp.net>
Source record: 73015
Cross-posted to: alt.radio.scanner,rec.radio.scanner

This morning I heard traffic on 155.535 MHz (our local S.O. frequency) that wasn't local traffic. A man was saying "Sheriff's Office to Mt Carmel Hospital". This was repeated several times, then I heard what sounded like one end of a short conversation. Now, I'm in Oklahoma and I find it hard to believe that I was hearing a signal from California. So, does anybody have a Mt Carmel Hospital in their area and also have a sheriff's office that uses 155.535 MHz.

Thanks
Mark

269. USA AR8600 hidden gaps?

Newsgroup: rec.radio.scanner
Date: 2001-01-04 09:06:13 UTC
From: mark <mark@yahoo.com>
Message-ID: <3A543D06.5C025AFE@yahoo.com>
Source record: 73017

I just received my Yaesu vr-500, and feel very disappointed.
It now turns out that 'cellular blocked' means not two but SEVERAL gaps
(in the 700 and 800 zone). So they are now protecting the 'images' of
cell communications!!. The point is why Yaesu doesn't state it clearly.
The specs of vr-500 are misleading.
Now, I was waiting for the vr-5000, but after this I am not more
interested in it. Instead I am considering buy an AOR AR8600.
Can anybody inform me about 'holes' (gaps) in the USA version?, I mean
besides the two standard gaps, are there some others?

TIA

Mark

Ted - I use an Austin Condor, a rubber duckie about 12" long, which gives impoved reception on all bands including 800mhz. I have it mounted on a window clip from Radio Shack that puts it outside on the top of a rear window. Very satisfactoy for all bands, especially on my TrunkTracker. You can also get a clip, from RS, with suction cups to attach to inside of window for less visibility/more security. You could use this with the Condor or a standard rubber duckie. The mounting clips from RS have BNC connectors with coax included. I haven't checked the new catalog but I think they are still available. I think Grove Enterprises carries the Condor. It's about $30. Let me know if you need help locating any of these items.

They could have been calling for the hospital in Carmel NY. The NY State Police frequency (which at times is shared with the Sheriff's Office) is 155.535. Do you have any further details? About what time in the A.M.? I could try to verify it.

You can return any christmas gift to RS until Jan. 24. Just yesterday I returned an unwanted gift to them that was bought Nov. 3. You might want to contact corporate HQ if the store is uncooperative, you will get authorization immediately to return the gift. Why would you want to sell it for less than the retail value you can receive just by returning it and picking out something else worth the same amount? Wouldn't that be quicker and easier? By the way, a lost receipt does not mean anything either, they now have the means to look up that info.
Good Luck.....

Hi,

I live near Pittsburg, Kansas, which does indeed have a Mount Carmel
hospital, and our sheriff's department (Crawford County) uses 155.535 for
Tac 2.

Source record: 73030

The "old" frequencies still work as of this morning (01/04/2001).
Here are the one's I use for the Metro Police:

155.010 - Central
155.310 - East
155.070 - West
155.580 - Records, Channel 4
155.130 - Countywide
154.755 - Car-to-car, special operations, Channel 6
154.860 - South
155.640 - Traffic
155.535 - Davidson County Sheriff

I'm scanning the fire department frequencies I have and hear no
activitiy. The trunked radio site below says the Fire Department has
gone trunked and does not simulcast on the old frequencies.

Here are some sites that may help you:

http://members.aol.com/Airfoils/ScannerNashville.html
http://www.trunkedradio.net/trunked/tn.htm
http://www.trunkedradio.net/trunked/tn/nashville.htm

Happy listening.

Monte

I recommend that you pick up a copy of 'Passport to Worldband Radio'.
They have reviews on virtually all new shortwave radios available and
have good info on selecting a radio. They also have a pretty extensive
listing of shortwave stations and their air-times as well.

Most large book stores carry Passport, but you can also get it on
Amazon.com and Universal Radio.

Universal's web site is:

http://www.universal-radio.com/

Take care;

Don Levstik

Upper Side Band and Lower Side Band are both SSB. You can find a lot of stuff on the HF [high freq] bands. Military, Airliners, Coast Guard, Amateur and more. I never heard anything on SSB on UHF or VHF unless it is Amateur Radio OPS or certain phones.

296. Cell-Able Scanner List Pre/Post Ban

Newsgroup: rec.radio.scanner
Date: 2001-01-04 21:11:34 UTC
From: headshope@aol.comm.htspm
Message-ID: <20010104161134.19889.00006761@ng-ft1.aol.com>
Source record: 73045

Best list I have found to list scanners that were cell-able right out of the box: PRE-BAN (US)

MODIFICATION FTP SITE: ftp://nic.funet.fi/pub/ham/rigmods/

J.I.L. SX-400 AOR-950 Icom R-7100 *

Regency MX-4000 AOR-1000 Icom R-1*

Regency MX-5000 AOR-1500 Icom R-100

Kenwood RZ-1 AOR-2500 Icom R-9000

Uniden BC-800XLT AOR-3000 * Icom R-7000

Yaesu FRG-9600 AOR-8000 *

The following are listed as cell-able after some form of modification/etc.

(NOTE: a * indicates some note/date code/critical information at bottom of this list)

PRO-2004 BC-855XLT *3 Regency 4030

PRO-2005 BC-200XLT Regency 1600

PRO-2006 BC-205XLT Icom IC-R10 *7

PRO-2022 BC-760XLT *4

PRO-2026 *8 BC-700A *3

PRO-2027 BC-890XLT *4

PRO-2030 BC-950XLT

PRO-2032 BC-2500XLT *3

PRO-34

PRO-37

PRO-39

PRO-43 *1

PRO-46 *2 *5

PRO-51 *6

PRO-23 *6

Note 1: Date code of 2A4 (Feb94) and prior, any xA3, any xA2 (label in battery compartment), or no "A" in the serial no. (Date code 3A4 (Mar94) and after WILL NOT WORK !)

Note 2: Date code of 2A4 (Feb94) and prior, any xA3, any xA2 (label on back).

Note 3: Date of mfg code must not end in the letters "ID" or after. (ID=94), except for OAID (Jan94). (On BC700A some "OBID" (Feb94) work)

Note 4: Date of mfg code must not end in the letters "ID" or after. (ID=94)

Note 5: Units with date code of 5A4 (May94) can tune the restored frequencies in 30 kHz Steps using a keyboard entry sequence after a wire on the "newly attached" daughter board is snipped.

Note 6: Units with date code of 6A4 (Jun94) and prior (and some 7A4) can tune the restored frequencies in 30 kHz Steps using a keyboard entry sequence. After date code 7A4 (Jul94) no mod can be done.

Note 7: The current 1998 models are. New reports say Icom is now only importing non-modifiable versions.

Note 8: Model (catalog) number with "B" at the end not modifiable. (Reported no L201 jumper on the circuit board)

FTP for MODIFICATIONS: ftp://nic.funet.fi/pub/ham/rigmods/

I DO NOT OWN/SELL/TRADE ANY OF THESE RADIOS NOR DO I HAVE/DO MODIFICATIONS.

I am unable to answer any questions about these radios.

--*-*- NOTES ON CELL ABLE RADIOS-*-*-*-*
To monitor cellular frequencies in the USA is a Federal Crime unless:
You are working for the cellular phone company and are authorized to monitor at that time, or are a police officer/agent/authorized rep. with court authorized warrant to monitor that call/phone/esn; for that period/cause as sworn to obtain said warrant.

Radio Shack has a nice model on sale for 99$US.

Cat. Number: 20-230 ,

Does: AM/FM/SW and SSB

Wish I had waited a few more weeks for this model.

Good for entry level or advanced in my opinion.

Pick up some books on Short Wave, visit
http://www.anarc.org/naswa/

Try the Short Wave Radio Newsgroup for further details.

Happy New Year

Jason,
Please buy a copy of "Windows for dummies" or the Video Professor series of computer instruction, there is a section that will teach you how to copy and paste.
A hint would be to copy the whole link path and then paste it into your browser.
After you master that get a hold of some humble pie.
Goddam you CAL's are weak.

Try the Bag Type antenna or a window clip type from Radio Shack.

I understand the Thru-Glass types are no so great for scanning outside cell bands,
signal loss like a rusty TNC.

Shop around, there are a ton of old antennas at Goodwill/Yardsales.

305. speech inversion descrambling!

Newsgroup: rec.radio.scanner
Date: 2001-01-04 22:05:07 UTC
From: ctpds49@aol.com
Message-ID: <20010104170507.03802.00000974@ng-fy1.aol.com>
Source record: 73054

Speech Inversion is accomplished by mixing the speech spectrum
(typically 300-3000 Hz) with a tone (commonly 3500 Hz) to produce some
audio frequencies (3800-6500 Hz) then filtering to 3200-500 Hz
constituting the speech inversion.

Hello all,

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1204891659
I have a Pro 2035 1000 ch 1.3 Gig scanner radio for sale on ebay.
There is less than 2 days left.
Currently $88.00 with NO reserve!

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1204891659

More info on this scanner can be found here:

http://support.tandy.com/support_electronics/16587.htm

Thanks for looking,
Adam / kc7ljq
nukingcats (at) home (dot) com

copy of ad

Pro 2035 1000 Channel Scanner
Covers 25 Mhz ---> 1.3 Gig!

This scanner is the replacement of the ever popular PRO-2006 only w/
a tuning knob and 1000 channels. It's very similar to the Pro-2042.
This is a powerful scanner, yet I am selling because I am a starving
college student, w/ more school than money.

Scanner is in great shape w/ the exception of some slight warpage on the top
part of the scanner. (hey, it's HOT here in AZ!) However the scanner is
works great!

PRODUCT FEATURE LIST:
Channels of Operation:..... 1100 Channels in Any Band Combinations
(100 Channels per bank x 10 banks and 100 Monitor Channels)
Coverage.....25-520 760-1300 MHz
Scan ..... 50 channels/second
Search..... 50 steps/second
Steps ..... 5, 12.5 & 50 kHz
Modes ..... AM, FM & WFM
Attenuator .... Yes
Data skip ..... Yes
TAPE OUT Jack
Audio 1.8W
Memory .... non-volatile
Power ... 120V AC 14V DC
Size ...10.5"(W) x 4"(H) x 7.5"(D)

Supports computer-controlled scanning w/ additional interface.

If it's clean, no signs of abuse, or wear, and everything works as it should, probably between $600~$750.00, from I've seen. Although many ask for much more...but I doubt if they're actually getting it.

I just picked one up in an ebay auction. Haven't received it yet, but the owner claims that it is fully functional and physically has only a few scratches on the enclosure. We shall see. The winning bid price was $510. Since I have been looking for this item the prices on ebay range from $600 to $750 depending on condition and what other goodies were included in the deal.

Hope this helps.

I just bought an icom R7000 and want to use it for wx satellite reception among other things. One thing that I was considering is to record the output of the satellite pass to a tape recorder and then play the recording later into my computer for processing. I could also use the recorder to activate on some of the more "interesting" but relatively inactive channels here in the DC area.

My question is what would be a good tape recorder to get for this purpose ?

Thanks,

Terry, AB4UM

You probably were hearing an exercise. STARGATE is an E-8
JSTARS aircraft, which is kinda like an AWACS plane, able
to direct other aircraft in ACM - Air Combat Manuevering -
(dogfights). STARGATE is the callsign for the controllers in
the rear of the aircraft; RAZOR is the "front-end" callsign,
the cockpit callsign for ATC purposes. 364.2 is NORAD's
AICC - Airborne Intercept Control Channel - a good freq
to keep in the radio, as it will be used for the occasional
"scramble" by fighters sent up to intercept unidentified
aircraft entering U.S. airspace that are suspect. They
obviously also use it for training, and even just to call each
other at times, probably because they may keep it on their
radios fulltime as well. I found the callsign HUNTER to be
associated with an F-18 squadron, I'm not sure where from,
and TANGO may be a temporary callsign used by just
about anyone, or possibly it was an AWACS aircraft, which
use callsigns like DRAGNET TANGO or DRAGNET ALFA
or somesuch; the phonetic suffix identifies the particular
flight, as a number would. DRAGNET, by the way, is the
"back-end" callsign, while the "front-end" callsign would be
SENTRY (followed by a number, like SENTRY 40).

That's a pretty lame attempt to evade the original question Toilet Boy.
I know you have a VERY limited intellect and an equally limited memory,
so I'll remind you of my post from over 48 hours ago. Since you have
failed to prove your club web site claims of fraud, that makes you a
liar. As always Toilet Boy, you are still a liar and a fraud.

My post from Tuesday, January 2, 2000:

> More proof of your "grossly criminal reputation" like your failed

The page loads fine....

However, when I type in the FCC code for my garage door opener
HBW1D3469.... I get the above errer? Wierd?

http://www.mods.dk/

I don't see the beep delete mod listed in the 2026 section.... but it
is in the 2006 section. Perhaps they are similar?

Can't you just find the speaker (or piezo) and hack it out?

Forget the discone. You will have better luck with the higher gain Radio
Shack antenna 20-176 that only costs $20. Smaller and works better.

Source record: 72947

the Bearcat 860 XLT will pick up cell images if you set search between 894.0125 and 915.6. You can have the scanner modified to unlock the actual cell band which is 869-894, but it is not worth it since the image frequencies given above cover 85% of the cell band anyway. Whether this is illegal is moot, since, technically, one is listening NOT to the cell band but to 894-915, and any scanner buff could be expected to search around the whole range of his or her scanner. Also, it never was illegal to listen to the older cordless frequencies on 43, 44 and 46 MHz, but only to use imformation from such listening. In fact, as above, I only found cordless frequencies by accident while searching for Sheriff and Hwy Patrol frequencies in the 40-50 MHz range. By the way, those cell images are the result of the Bearcat 860XLT having an IF of 10.8 which, doubled, adds 21.6 to the actual cell frequencies.

on ALL 800 Mhz scanners!

Sure, if you are not in an area with cellular, or no one is using cellular when you are scanning, THEN not.

> And since you can only hear one side of the conversation these days, and

No, I know what I am talking about, you don't as is obvious below.

> > Use the money to buy a touchtone decoder display and listen to cordless
> phones!
>
> Wrong again, don't buy a decoder, just listen, those frequencies are
> unblocked on all scanners, even the $50 bc60xlt-1 from Uniden online

You don't even know what a touchtone decoder is or you wouldn't have made such a silly statement!

Don't be so quick to tell other people that they are wrong, it is possible, don't you think, that there are some people that know a bit more about certain things than you do?

You should do what I do, if you are not 100% certain about a topic, don't post any comments or statements just because you THINK you know something. I never post or make any statements unless I am positive they are 100% correct. I know that is unusual for newsgroups, but some of us follow that logic. Try it.

No, I know it wasn't intermod, as I heard it on two different radios, one dual-conversion and the other triple conversion. Also, there is no Mt. Carmel hospital in Oklahoma, as far as I've been able to find out. The time was roughly (very roughly) between 8 and 9:30 AM CST. I work evening shift, so was not up yet, just barely awake and didn't think to check the time. Heard it on a scanner I keep on low volume on my nightstand, was so surprised I grabbed my Pro-43 off the dresser and flipped it on to check the signal. Just caught the last of the traffic as I turned it on, then the priority channel kicked in. By the time I got priority turned off and got back on .535, it was gone.
I must say, NY seems slightly more likely, as at that hour of the morning I have picked up stations in Arkansas, Missouri, and Mississippi previously.

NOW that's what I call SKIP!!

Tom,
Now this makes sense, as we hear other Kansas PS agencies from time to time, for instance I hear a university police agency (in Wichita, I think) on 460.325 MHz quite often during the night and early morning. Per your other post Tom, I'm in Stillwater.
Thanks to all who responded,
Mark

Another option is to use a program called RecordIt. If you have a Zip
drive, this is a freeware program from Iomega. It creates MPEG-2 files
More info at this link:

http://www.iomega.com/support/documents/10240.html

If you want a standalone recorder, a mindisc recorder works great. In
the mono mode, it can record 148 minutes of digital audio. The trick part
of this is it allows you to add track markers before and after the
"interesting"
audio section and delete everything before and after it. Since it is
digital,
rather than analog, it doesn't need to erase it, it just deletes it from the
TOC
(Table Of Contents), which happens in only a couple of seconds. You
can have up to 255 separate tracks, add titles to them, and jump between
tracks (like a CD player). The media is cheap, almost indestructible, and
won't wear out (rated at 1 million cycles), unlike tape.

Have fun,

Robert
http://home.cfl.rr.com/scan/

Why not just record directly onto your PC through the sound card?
You'd have to use a high enough sampling rate (2 or more times the
highest audio freq you expect), but it'd be mono, so the files
wouldn't be that huge. Rigging up the PC to only record the
desired info might be interesting...if the satellite passes happen
at known or calculatable times, you might be able to use cron
(Unix) or the Windows scheduler to do something like "turn on at
4:32 PM and record for 5 minutes".

If the desired recording times are more random, you have to do
a little more work...you can use one of the standard "tape recorder
controller" boxes that go between your radio and a recorder, but you
would run the audio into your sound card and the "turn on" input to
one of your other ports (serial, parallel, joystick). You'd have to
write a small program to start and stop recording when the line on
the port changes state.

Another idea is to use an old VCR and record audio only. You can
get 2 hours on a tape (instead of 45 minutes for one side of a
cassette) and the VCR even has its own timer. Some older models
even have a "pause" input like an audio recorder, but generally
you have to be careful with this...if you try to keep it paused
for more than 5 or 10 minutes it may go to "stop". If this
happens and you then unpause, you may lose the first few seconds
of audio as the tape reloads and comes up to speed.

Otherwise, look for an audio tape recorder with a "pause" jack.
You may have to attenuate the headphone audio from the scanner
so it can be fed to the recorder's microphone jack - or the tape
recorder controller may do this for you. A tape counter *might*
be useful. I would say to stay away from mini-cassette and
micro-cassette recorders - just get a regular audio recorder.
I'd guess that you should be able to get something that will
work for US$50 or less.

I hope this helps!

Matt Roberds

Try to make the search area a bit smaller. VHF -hi doesn't usually go over 400 miles or so. There are extremes on the band and anything is possable. But I bet you find your target somewhere in texas or a little closer.

My Country...The Government of Mexico Employs his services to monitor the progress of high speed car pursuits that begin in the United States. He performs this service to enable the "Grupo Beta" the Mexican version of your Border Patrol...to be ready to catch offender that enter our country during theses chases. Unfortunately the American Law enforcement cannot always notify us of the chases in a timely manner and that can cause an embarrassing situation at our port of entry. Bud calls me office a few times every month to pass this information directly to my communications center. Bud also recommended the purchase, and will be training my staff on 12 Uniden BC-780's for our new communication centers on Tijuana and Mexico City.

I may be very hard for Mr. Macky to think that my country has an interest in not shooting every US citizen that violates my country's borders...but we like American tourist and prefer to keep the citizens of Mexico and the United States free of crime while visiting our fine country.

Please come to visit some time John Macky...we might even let you leave at the end of the day.

There was a nuck missle launched by a radical group in Durham N.C a few nights ago. The Air forced sent jets to Durham and destroyed the town and the rebels.

It was a secret operation so it was not on the news.

Good catch on the scanner though....

SENSATION ART BELL RETURNS IN RADIO SHAKEUP

Exclusive

Radio sensation Art Bell is planing to stage a dramatic return to the nation's airwaves, the DRUDGE REPORT first revealed Thursday afternoon, reclaiming his overnight slot with an expected 400+ station lineup.

MORE

With legal dramas behind him [Bell sued a broadcaster for libel in a case that ended in settlement] and personal family concerns on the mend [his son was sexually assaulted by a school teacher that was carrying HIV], Bell inked a deal last week to return to the waves, according to sources.

"He's rested. He's ready," says a source close to Bell, who will once again broadcast to millions from his home in the Nevada desert.

Bell is expected to continue his trailblazing reporting -- 2001-style -- on science, earth changes and assorted religious themes.

Bell has drawn strong criticism for airing predictions of imminent massive earthquakes in South California and was at the forefront of the Y2K computer madness

Bell continues his relationship with syndicator PREMIERE -- with several key affiliate switches in play as this transmits.

Bell will jump stations in the nation's #2 market, Los Angeles [darting from KABC to KFI, which is owned by PREMIERE's mothership CLEAR CHANNEL]; and it was not clear if Bell will return to WABC in New York, the nation's top talk outlet.

One top ABC source cautions Bell's return to WABC is up in the air.

"He's quit twice, and come back three times. In two years?" the executive questioned late Thursday. "He could do a first hand testimonial on time travel."

Developing...

According to the "Curtis and Kuby Show" this morning on WABC, Bell will be working for that station much to the chagrin of Republican Curtis Sliwa. Why wouldn't he work for something as big as it? It's the number one station heard on the Internet and according to the station manager, receives QSLs from New Zealand. Being New York based, it's the BEST..THE BEST...EH...EH...EH...HEH..HEH...HEH...QUEENIE...QUEENIE...PITTSBURGH..... AF2Y

381. Need assistance with BearCat 178XLT

Newsgroup: rec.radio.scanner
Date: 2001-01-05 14:03:02 UTC
From: Ted Wagner <trwagner1@MailAndNews.com>
Message-ID: <3A867570@MailAndNews.com>
Source record: 72979

Quick review on my problem. I bought a scanner at a garage sale a couple years back. I used it a few times, worked great. Cleaned up the garage and found the Bearcat 178XLT, dusted it off, plugged it in. Power came on, but there were no channels. All of them were set to 00000 and each had the lockout indication L/O. I can do a search between frequencies, but I cannot store any frequencies in any of the memory channels. Every time I try, I get
a ERROR or Lockout error. If I manually enter a frequency, the same thing happens. I did not get the scanner with a manual. Hey, for $10, I didnt care
too much. I'll add that I've tried pressing the lockout button, but it never
changes.

I checked Uniden's website. One of their non-specific FAQ messages says to try pressing the 2+9+manual keys at the same time, then turning on the scanner, then releasing the buttons. That didn't seem to have any affect.

Has anyone ever encountered this problem? I've emailed uniden, but have received no response yet. I can buy a manual for $7.50. But, if I've only invested $10 into this, I don't want to spend another $7.50 to find out it has
to be repaired. Might as well buy a new one.

My searches on the net turn up dry other than to find other 178's for sale.

Any advice would be greatly appreciated.

Ted Wagner

Handheld: Yupiteru MVT7100 (owned for years)
Base/Mobile: Uniden Bearcat 780xlt (gotta get one!)

Many close runners up:

Hanhelds:
Yupiteru MVT9000
Icom R2
PRO-43

I loved my long departed cobra SR-15, but no 800 Mhz, big fun factor

Many other great rigs for big bucks out there today

see the reviews at:

Hello,

Not familiar with this model!

Most had a battery to back-up the memory.
Have you replaced it with a new one?

//John

392. E-Bay Morons Remove My PRO-2006

Newsgroup: rec.radio.scanner
Date: 2001-01-05 17:23:25 UTC
From: leadenwah@aol.com
Message-ID: <20010105122325.13883.00000032@ng-fx1.aol.com>
Source record: 72991

I had a PRO-2006 w/Opto 456 (LITE) offered on E-Bay, but it was removed without explanation. I don't yet know whether the Morons who operate E-Bay simply did this just for the hell of it or whether some jealous competitor made a false complaint. The fact is, the item (# 1205355875) was removed without my notification or consent.

I hope that the bidders who were denied the opportunity to complete this acution will understand that this highhanded and improper action was NOT my doing.

None of the prohibited " keywords " were used and the term " cellular " wasn't even hinted at.

Have any others had such problems with these bums?

Geo.

File a complaint with the BBB, State Attorney, Local News, Postal Inspector.

Document every call/email.

The BBB will provide you with all the needed forms, takes time but for those who take the time to check with the BBB before doing business with anyone it will help.

There may be a crime here; they have your property and have not payed for it.

The local news loves to take big business to bat for bad efforts, give them a call.

(Please no direct emails to this address, all email will be forwarded to tosemail1@aol.com and or spam@aol.com. - I will read all replies here, thanks.)

Modification to a FRS radio is very illegal and can cause some big problems for licensed users of close frequencies.

GMRS is often the victim in the FRS mod craze. One user; REACT a self supported group that provides emergency aide to you and me have reported problems from unmodified FRS signals.

As for the techincal side of things:
FRS units only put out so much power even with the best antenna mod possible, and all the screwdriver surgery you can hack...

Now do we all remember the "Golden CB Days" where some trucker in Wallawalla Washington was blasting from Channel 10 to 21 all the way to New York??? or something close?

On a note: MURS is now available license free and uses much more powerful radios, plus the Modes you can use will entertain you for years.

HAM licenses are quite easy to get and offers MUCH better equipment,repeaters, more power and more...

GMRS licenses are cheap and you can use repeaters for a small fee.

Cellular phones are quite cheap as is airtime cards if your credit is poor.

Hopefully the FRS MOD craze will die quickly... how long was it since there was another license free service made available since CB?

(Please no direct emails to this address, all email will be forwarded to tosemail1@aol.com and or spam@aol.com. - I will read all replies here, thanks.)

Hello to all

I am looking to buy some crystals for the old Bearcat III & IV models as well as the Regency line (I realize they are not the same).

If anyone has some available, please send me a list of the frequencies, which radio they are for, and price desired: either each or for the entire lot.

Please respond to my email address vs posts.

Thanks to all for the time.

Just a quick review of procedures for most Uniden scanners. Hit manual and step to the channel you want to program. Enter the frequency you want to monitor (which does have to be within the scanner's operating range). Be sure to put the decimal point in the frequency entered, there is a key just for this. Then hit the enter or E key. That should program the frequency in the selected channel. Do you have a Nat. Weather Service broadcast in your area? That's a good test frequency to use. (try 162.400) You might have to plug the scanner in and leave on for a while to recharge whatever power source is used for backup.

Hope this helps,
Mark

At least there will be SOMETHING interesting to listen to on NYC radio. We are facing the possible loss of listener-supported WBAI because of a power grab from the Pacifica national board, who wants to either sell the station outright, or turn it into a bland, inoffensive corporate-friendly NPR clone. Last year, they tried to do the same at KPFA. Join the fight against the destruction of this historic network and wonderful resource for social justice!

Thanks everyone for the help. There were some really good suggestions here.

After some consideration it seems more reasonable to feed the receiver directly into
the PC and use software to do the recording. The wxsat program detects the signal threshold and automatically determines when it should begin and end the record. Another program mentioned in one of the posts uses a similar method to determine when it should record and can be used to record just plain audio. If these programs work well then this would be good solution.

Thanks again,

Terry, AB4UM

I agree with Dan. As a long time reader of this NG, I have found Rich to be a fair and excellent contributor to this hobby. Long ago I wrote to Rich, thinking that he was Rick Wells, and he replied to me that he wasn't, in a most graceful way, which helped keep my
embarrassment factor down. I would like to hear "the rest of the story" also.

Our country has not the money or resources the police in the United States have. You are free to form your own opinion of my country. I find you statement about my people to be racist and vile. You are a bigot John Macky. I have placed your name in the MEXID crime computer and noted that you are to be arrested and held for questioning should you attempt to enter Mexico. I have also attached the picture of you with a beer in your hand and a dirty shirt.... and the plates on all cars registered to you that was provided by the Oregon DMV. You are also welcome to call and discuss this with me at the phone numbers I have already posted John. It is sad you must make such a broad racial slur to many fine Mexicans living in your country.

I only hope I have a chance to return the favor soon!

Mark

Oh BTW....166.300 is my frequency.....

This has been documented many times on American newscast in San Diego. We have an average of 4 chases that end up in our country each month. I'm sure you have noticed the 2 chase cars we have stationed 24 hours a day at our port of entry now. This is also well documented in the local American and Mexican prensa. I am the offical spokesman on these chases and report the arrest details to the American reporters...they all know me by my first name.

So what part are you having a hard time with????

420. FS: Realistic Scanner Crystals

Newsgroup: rec.radio.scanner
Date: 2001-01-06 00:21:37 UTC
From: hudsonvalleycomm@aol.com
Message-ID: <20010105192137.14795.00000029@ng-ba1.aol.com>
Source record: 72919

Hello. I have the following crystals here that came out of units that I have bought and restored. These are for any scanner with a 10.7 IF (i.e. Realistic, Midland,Pace etc). These will not work with Bearcat scanners. See my other list for those scanners. Listed below is a few local frequencies for my area that I would be interested in trading for, regardless of IF, 10.7 or 10.8. If not, the price on these crystal is $ 1.00 each and $ 1.00 to ship as many as you buy. Thanks!
37.060 155.130 453.250
37.080 155.300 453.325
37.100 155.625 460.550
37.180 156.330
37.200 156.570
37.240 158.850
37.280 162.400 (x2)
39.980 162.550
44.740 158.745
45.100 158.790
45.200 158.970 (x2)
46.560 159.030
46.260 159.150
154.370
154.875
154.815
I am intersested in the following frequencies: 33.480, 46.460, 46.340, 46.300, 46.480, 155.025, 155.220, 155.175, 158.760, 155.535.

I don't think it was from you saying how you felt about the radio but I belive it was from you going off on the people there. He said he had trouble with you before so I really don't think he was in the wrong. As far as the radio goes if I was you I would send it back for another one. Since I read what you was saying about the audio I took a ride with mine in the car and it was great. I had the heater and car radio on at the same time and I could still hear the scanner just fine. I didnt even half to turn it up very far. As a matter of fact my wife made me turn it down. As far as the manual goes I really never looked at it yet so I can't say anything about that.

Here is the message that has your name next to it. Belive me I'm not trying start any problems with you I just feel that Rich will treat you fair if you follow his rules. I thought you said something about the manual somewhere but I must have been mistaken. I belive it was the part about the disservice and the shame on you that did it. The rules state that you must be considerate of each other.

Shame on you Uniden, Greg Knox and Rich Barnett for letting this radio go into production
with its lousy audio! It's the worst audio I have ever heard and may be worst in fidelity than the Pro-94.
When I spend $370.00 on a radio, I at least expect to hear it with decent audio.
Your previous flagship: 9000 XLT, had poor audio, but at least when I "cranked it", It was okay in hindsight!
You guys did a great disservice to every one of us hobbyist and I'll never, ever forget it.
The audio isn't fit for home use, let alone mobile use.
BTW, What good is a mobile unit when you can't control the ATT and the ID L/O while being mobile?
This radio is more hazardous to use than a Cell phone. I could overlook this if the audio was good.
What were you thinking when the BCT-7 has much better audio?

There may be some good news that comes from this.... GRE should get it right the next time around!

Kinda looks to me like you are admitting you did go off on some people. I didn't see your posts, so I can't (and won't) make any judgement about the situation. However, I've found Rich to be a fair individual. Criticize the equipment all you want, just don't get personal about it.

Mark

Not everybody would see the difference, Whether or not I feel your comment was out-of-line doesn't matter, it's Rich's website, and he gets to call the shots. As I said in my previous post: "Criticize the equipment all you want, just don't get personal about it." You could (probably) say that the people at Uniden are a bunch of incompetent schmucks, and get by with it. But when you start naming names, that's a whole different game. For one thing, you start tugging open the door on possible libel claims. It's been many years since my college journalism class delt with libel laws, and I have no idea how they would apply to the Web, but as owner of the website, Rich has a right to be concerned. It's your freedom of speech rights vs his stay out of court rights. He has apparently chosen to err on the side of caution, and I don't blame him.

Live and learn
Mark

Toilet Boy, the magnitude of your continued persistence with this
fantasy is equal to the magnitude of your psychosis. You know you are
a liar, I know you are a liar, and anyone who's visited this news group
for more than 11 seconds knows you're a liar, too.

> Provide verifiable proof of your accusations within 48 hours or be
> found to be a liar.

I have already done so many times. It is a function of your mental
illness that doesn't allow you to admit this fact to yourself. You made
a tremendous breakthrough when you finally admitted your infamy, and
now you renege on your therapy and continue your lies. You are not
famous, except in your delusional mind. You are infamous. Don't forget
that you are a liar and a fraud, too.

Kind sir, please allow me to gently disagree with you. John "Toilet Boy" Mackey has repeatedly deceived this news group and misrepresented himself and his alleged technical skills. His feeble attempts at his misrepresentations are weak and transparent, and for more than four years the members of this news group consistently have seen through his lies.

> He is a liar...
> So we can still kick his sorry ass around this newsgroup a few more times. At
> least until he deflates or has to take a nap.

The sad part is each time Toilet Boy is proven a liar, he keeps coming back for more. He is truly a pathetic psychopath.

> (falsely) indicated.

This is a lie, Toilet Boy. You attempted to sell Extra Class Licenses
to Novices and your despicable plan backfired. You had to make up
another
lie to cover your actions so you and your moronic PARG cronies concocted
the story about a fraudulent flyer being distributed to the amateur
community. That is your attempt to deflect suspicion from you and PARG.
The "authorities and the US Postmaster" will discover this fact soon
enough through their investigation. That is, if you haven't lied about
this as well.

"Rights" do not arise in private property or spaces. Rich Wells is
incapable of violating anyone's free speech rights by definition because he
is not the government. The Constitution instructs the government, not
private citizens.

So, if a webmaster or BBS sysop does not want certain things said or
discussed via their equipment, they have an absolute right to impose rules
and limits and to enforce them.

He is not permitted to scan or otherwise reproduce the document. That is against our Federal laws. The card must be produced to any border agent or foreign police agency to recieve full diplomatic immunity and 50% discount at most hotels.

I'm sure a simple search with the internet would show you what you desire.

I've had a RS PRO-62 scanner for several years and it has given me good service. Several months ago it developed a problem: it would stop scanning on 160.650 as though there were an open mic. This does not happen on my other scanners.

Curiously, when I touch the rubber ducky antenna this stops. (It also occurs with one of those RS extendible whips.) It does not happen when I connect it to an outside antenna.

Any suggestions as to cause and cure?

Thanks.

==>ESCAPEES MAY HAVE STOLEN RADIOS; HAMS ASKED TO MONITOR

According to news reports, the seven Texas prison escapees still at large
and now wanted in connection with the murder of Irving, Texas, police
officer Aubrey Hawkins, KC5USI, also may have stolen radios from a Houston
Radio Shack store. The radios are said to include Amateur Radio 2-meter H-Ts
as well as Business Radio Service (programmed for 156.400 MHz) and Family
Radio Service (462.5625-467.7125 MHz) radios.

Hams have been asked to monitor these bands and report any suspicious
activity any hour of the day to the Huntsville Command Center, 936-437-6735,
and to their local law enforcement agency. Police advise that anyone
spotting these suspects not try to approach them but contact local
authorities immediately.

More information on the escapees is at
http://people.txucom.net/tdcj-iad/

The other possibility is that the backup is totally exhausted in which case it will need to be replaced.
I have an 6 year old Bearcat that uses a Lithium battery, these are good for quite a few years, but when they are gone they're gone. If as I assume, Bearcat scanners use CMOS memory to preserve channel entries, this would make sense. Of course, that does not explain why it won't work plugged in, unless it is designed that way to make sure that you replace the backup battery, I had a laptop like that once.

The best way to find out if that is the issue is to remove the cover on the radio and check the battery with a voltmeter. My backup battery is one of the lithium "button" cells similar to those in a watch but larger (unless you own a Timex). It is soldered to the main board of the scanner standing up and covered with insulating tape. Be sure to set your test leads on opposite faces (heads and tails) as the edge of the battery is actually part of the positive face. Likely voltages are 1.5 and 3 volts, which should be clearly marked on one face of the battery.

However, the below info is worth a try first, Bearcats are finicky about that decimal point. If that doesn't work, check the battery. If it is dead, you will have to replace it.

I have not "unwrapped" my battery yet but it is probably soldered to the board with "legs" that are spot-welded to the faces of the battery. If you can't find one like it locally, you should be able to find a local supplier of button cell "holders" - start at local computer repair shops, over zealous owner routinely break of the ones on their computer's motherboard. You can mount the holder on the side of the case and run leads to the solder points on the board.

If you just want to test the radio with a new battery, before you waste a lot of time let me know, I have a trick for doing that just email me, this post is long enough already :)

Just had an unmodified HR2510 10M rig dropped (actually went to the trouble to reverse the previous owner's mod.), while there is a 101 Yaesu blatantly advertising "75 to 125 watts output" on 11 meters. Asked about a Gen. TX modified Icom last week and was told that it was OK even though there was no mention of amatuer sales only,or requiring MARS/CAP proof of the right to use such a rig.......I think they have a "volunteer" (read: vigilante) group who routinely dumps anything that can be modified...unless it's something that they or their fellow afficionados approve of.

Getting a bit old, Yahoo doesn't bring the long money, but sure is a nicer place to sell.

Has anyone had anyone ever had problems ordering (importing) a scanner that is "full" coverage from bander.com (Bandercom)?

I am very interested in the ICR2 and they have a great price which is actaully cheaper that the ones I have found here in the states. I could really care less about the cell phone coverage to be honest. Doesn't even interest me. What I am interested in is the whole mumbo jumbo about customs and the FCC puttin you in jail and all the violation of the 1993 Telecommunications Disclosure and Dispute Resolution Act stuff.

Has anyone ever done an import of a scanner and had any problems?

Thanks for the info

This just made my local news. Apparently the escapees were spotted in a small Texas town checking out a bank. Still at large, but they did say that it looks like as many as two of the escapees may have been wounded.

BTW, I live in southern Ontario, Canada. A lot of sympathy up here for the family of the deceased officer. Lets hope they can muster the intelligence among them to use those radios so that you folks down there can help catch them. It might not be much, but I know up here they recycle unused call signs, may be in this case it would be appropriate to retire one. . ..

Pogo (aka "Rage" aka "Roger") was banned before due to a pissing contest he and another person had on my Message Board over a BC9000. They were banned. Pogo (Rage at the time) apologized to me and to a posting on the board for his actions. I felt he was sincere and let him back on but warned him that no further abuse would be tolerated.

Since he managed to alienate enough of the regular visitors on my board he, I guess, decided to change his name to Pogo. Everthing had been going smoothly until the 780 rolled out and there was a LOT of activity on my 780 board. He at first posted useful information and insights but as people began to post the same questions over and over his replies began to turn mildly annoying and at times abusive. I also received a few e-mails from board visitors who were getting tired of his rantings. I was keeping a close eye on him but didn't feel he had crossed the line so I just let him be. Looking back I probably should have said something but perhaps I'm assuming too much that the people who visit my site are adults and can behave as such?

One of his last good "rants" was the "Shame On You" posting which everyone needs to read for themselves. Stop by the BC780 board, go to the bottom and go into the Board Archive. Page down a bit and you'll see it. Makes for a good read.

And if I had a problem with the post itself I would have removed it. But he'd like you to believe that he was banned for insulting the 780 and/or Barnett and Knox (like Greg Knox has any

say over what Uniden releases - I tell ya).

Soon after that he made an insulting comment to one poor user who was asking a simple question and wanted to know what he could do to get around his problem. That did it in my mind. He was walking the fine line and then crossed over to the dark side...so to speak. I yanked his last set of abusive and semi-abusive postings and put him on the list.

Today I received about three e-mails from "Pogo." In the second one he says "And if you can feel you can easily ban me after all my years of service to the board.....
Don't ever reinstate me. Good riddance!!!!"

The third he wrote a few hours later and says "Let me back in. There is not enough topics elsewhere. ... If I do get back in, I'll have to change my name." First Rage, then Pogo and now what? He denies, of course, any wrongdoing but feels the need to continue to post anonymously and so that no one knows that he is the Rage and Pogo they all love.

Here's his excuse: "As for the post.... Look at the date and time stamp. Jan.1 (still New Years Eve) at 5:xx in the morning. I was tired and drinking all night."

So drinking and such, along with your great service to my boards, allows you to be a prick? I think not. And until someone invents a browser with a built-in breathalyzer to deny access when over the legal limit, I think it best if Roger/Rage/Pogo stays off the Internet.

And now you have the rest of the story...

> >Watch what you say or you could be banned, too! I'm not one of the
> >"good old boys", so I can't voice my opinion on his site.

Yes, there are only a few hundred people visiting my boards and somehow they never manage to get banned. I guess none of them ever voice an opinion, good or bad.

> No one using his site is a "good old boy"

I agree, Dan.

Although the symptoms aren't quite the same, I had a similar type of problem years ago with a BC-100XLT. It turned out that the duck or the longer antenna put enough of a stress on the BNC connector that one of the boards inside shifted position just enough to break a connection, Mine was on the squelch pot. I finally found it myself after it had already been back to Uniden for warranty repair with no success. Hope this gives you a lead to follow.

I downloaded the XRS extension "Hit Counter" and have run it a few times. The graph on the screen shows bars 'hits' in red and in a yellow/amber color. I read the "Help" but don't see the reason for the different color.

I have set the bar height for "Hit Count". What exactly does that mean? I have run it continuously. I would expect the bar to get higher when it rescanned and found activity on the same frequency.

Well, I cannot comment as to who is and who is not Pogo, but the evidence seems clear.

From his response below he seems to claim that he was not the one posting, and not the original "Rage". This seems highly unlikely. While it would not be appropriate to post them here, I am sure that unlike Pogo, n2mca probably has archived copies of the emails you sent him. If based on that and your posts to his board he banned you, I see no error. But then it is his board so if in the unlikeliest of circumstances he just banned you arbitrarily, that is his choice and there is nothing we can do about it nor should we be able to.

My advice, should n2mca's comments be true, is do what I do. Write all the scathing asinine replies you want. Just don't actually send them. I keep mine for at least a week, upon review I am either amused or embarrassed by most of them.

Bottom line sorry if you feel wrong done. Judging by the posts in this group, all the support is on his side.

I'm a big "Ebay'er" and i've noticed a big inconsistency when it comes to booting someone off because of their "illegal" equipment. I have seen blatant postings that tout "cell mod done" or "full coverage, no gaps" and make it to the end of their respective auction. I've also heard stories like yours Geo, where the bidding party is booted for no good reason. Makes you wonder.

Chris

Get out of here..... so because I am trying to save money and this scanner is out of country and just happens to be full coverage the FCC can seize it and make a case out of it? I just thought it was a good deal as far as price goes.

Goes to show you how much the American retail market is oversaturated and grossly over priced.

Thanks for the info guys.

Message-ID: <IBH56.70030$g6.29660187@news1.elmhst1.il.home.com>
Source record: 72887

I have a pro-43 and needed to replace the rechargeable batteries. I took the original battery(23-125s 1.25v) to rat-shack and asked for the same kind. They said they were replaced by 23-125 1.2v 700Ah. I noticed the difference with the "s". I have charged them for over 24 hours and still can not get these to work in the scanner. Is the voltage too low on these new ones or was I given the wrong kind? Anyone have a recommendation on the best battery to use?

Thanks

I have added the ability to auction off your CB/Ham or communications equipment on my website at ChargersCastle.com. This is a free service and there are no fee's at all like there is with Ebay and some of the others.

To check out the auctions already in progress, go to ChargersCastle.com and then click on "Castle Auctions". There you can view what is there or you can post your own items, and again, this is a FREE service.

Hope to see you there!

R E A L I T Y C H E C K

Toilet Boy, you're still a liar and a fraud.

1. It was proven you lied about the first date of your appearance on the Internet.

2. It was proven you lied when you denied making the claim about patronizing under age child prostitutes.

3. It was proven you lied when you claimed to have written "several technical articles" for the ARRL and other technical publications.

4. It was proven you lied when you claimed to have adopted your dead sister's children.

5. It was proven you lied when in the span of two weeks you claim to be married in one forum and single in another.

6. It was proven you lied about having college degrees.

7. It was proven you lied when you denied you were identified as a known Internet abuser by Joe Greco on his published lists of spammers and idiots.

8. It was proven you lied when you claimed you weren't stealing Internet access and your employer terminated you for theft of services.

9. It was proven you lied you claimed you've never used fictitious or illegal Internet address.

10. It was proven you lied when you claimed you were not the most prolific poster of off topic messages.

11. It was proven you lied when you said WD-40 was unsuitable for electronic use by posting another endorsement from Roy Lewallen, w7el@teleport.com, which you ignored.

12. It was proven you lied about your place of employment when I posted your work telephone and related data. It was also proved that *you* worked at that office and not your retired father.

13. It was proven you lied when you claimed that Bill Cheek had never
been a member of Mensa.

14. It was proven that you lied when you claimed
to have never lost an ISP for your forged cancels.

15. It was proven that you lied when you denied
using numerous fake identities on the Internet.

16. It was proven that you lied when you denied
you've never blown up a repeater system through your incompetence
and total lack of technical expertise.

17. It was proven that you lied when you denied
trying to break into other computer systems using Back Orifice.

18. It was proven that you lied when you claimed
you had "acquired MORE FCC licenses ... than could be counted
on one hand!"

19. It was proven that you lied when you claimed
you have made your "living from the Radio Communications Field
for most of the last 15 years."

20. It was proven that you lied when you denied
having stalked Bill Cheek for over three years.

21. It was proven that you lied when you denied
being kicked off Fidonet by Bill Cheek.

22. It was proven that you lied when you claimed
Bill Cheek had been kicked off of Fidonet.

23. It was proven that you lied when you claimed
a police had been filed supposedly about harassing phone calls
made to you at your place of work.

24. It was proven that you've emailed death threats
to your detractors on the Internet.

25. It was proven that you lied when you claimed to
"have helped resolve" the problems of the scanner newsgroups
and have "rid this NG of trouble makers."

26. It was proven that you lied when you denied
sending bogus complaints using aliases to the Internet providers
of your detractors.

27. It was proven you lied when youï¿½ve made dozens of rouge cancels over the
course of the last several years

28. It was proven you lied when denied stalking Bill Cheek since his death

That's it!? All this fuss over this message? That's overreacting if you ask me. Everyone is entitled to their opinion, and should be free to express it! There's not even any foul language, or name calling in this text! What's all the fuss about?

I have all the respect in the world for Rich Wells, and what he's doing for the scanner interest. I also understand his not wanting his message groups to emulate some of the trash we've had to tolerate here. But if there can't be two sides to every story, then the information becomes unreliable, don't you think?

Bill Crocker

In Internet Explorer, click on Message, then click on Create Rule From Message. There you can tailor a rule that IE applies to all downloaded messages. I've got at least 5 different Mackey rules, a KSOF rule, etc. And just below the Create Rule is Block Sender. These two options filter your downloaded NG messages before you ever see them. Very handy. I'm sure Netscape has a similar feature but someone else will have to tell about that.

Please send to all scanner enthusiasts, SWLers, and hams that you know in the US & Mexico:

==>ESCAPEES MAY HAVE STOLEN RADIOS; HAMS ASKED TO MONITOR

According to news reports, the seven Texas prison escapees still at large and now wanted in connection with the murder of Irving, Texas, police officer Aubrey Hawkins, KC5USI, also may have stolen radios from a Houston Radio Shack store. The radios are said to include Amateur Radio 2-meter H-Ts as well as Business Radio Service (programmed for 156.400 MHz) and Family Radio Service (462.5625-467.7125 MHz) radios.

Hams have been asked to monitor these bands and report any suspicious activity any hour of the day to the Huntsville Command Center, 936-437-6735, and to their local law enforcement agency. Police advise that anyone spotting these suspects not try to approach them but contact local authorities immediately.

More information on the escapees is at http://people.txucom.net/tdcj-iad/

I guess I should mention the obvious and that is the Pro-43 has two jacks
on the side of the scanner. One is for running it off of an external supply
and it will not charge the batteries. The other jack is for solely charging
the batteries. Make sure the right one is being used. Forgive me for
mentioning this if you already know it.

Hopefully your charging circuit is working properly. The battery voltage
is the same on all "AA" nicads. Just the current is different. You may want
to charge the batteries externally with a different charger to see if they
will
hold a charge and then place them in your radio. The voltage after charging
will be 1.25V up to 1.4V. They will settle to 1.25V after sitting a while
after
removing them from the charger. You may need to invest in a cheap
voltmeter. That is what I use and it helps to weed out the trouble batteries
after they get older.

I am considering using the nickle metal hydride batteries in the future on
my radio equipment. They just seem to last much, much longer that ni-cads.

Good Luck,
Ed N4UMJ

I believe a lot of it is whether or not they get a complaint, and
there are some people out there, that have nothing better to
do then complain.

Try these batteries and see if they work with a portable cd player or
radio. My Pro-92 had a "voltage" problem with a set of ni-cads and
wouldn't work my radio. Your best bet is to buy NiMH batteries and an
outside charger from Maha. Here is a good place to shop:
http://www.thomas-distributing.com/batteries.htm

New ni-cads require a few charge/discharge cycles before they hold
full capacity.

I have just bought a Winradio 1500i and I am unable
to recieve anything on SSB/CW.
I have even tried tuning to a frequence on 27mhz and
transmitting on USB right next to the device with no success.

I can recieve a full 30db signal on FM and switch over to
USB/LSB and not even get a peep after tuning around and altering
the IF shift etc.

Can anyone please help me

Thanks

Davey

That's too bad. Most of the post that i've read from you was being mostly helpful. It appears that you have a lot of knowladge about a lot of radios. It looked like to me that Rich viewed your post as a flame and that's why he booted you by reading his two responses to that thread. It also appears that you were not liked because you criticized everbody's new toy. If a view is in the minority then you won't be liked very much.

But, yes, it appears to me that you were booted out for complaining too much about the audio and the two guys you named in that post. Too bad!

Isn't this cellular BS getting overblown nowadays anyway? I mean, aren't like 90% of all cell phones now digital? Doesn't that mean they can't be monitored on an analog scanner? It's a great marketing ploy to have the full 800 coverage cuz we all know how important it is to get what we're *not really allowed to have* but again, practically speaking, is cell monitoring as good as it was when everyone was on analog phones? Since general cell use has gotten so huge I'm sure there are people still out there with em but they hafta be like what...the lower end of the cellphone user spectrum no? Like the "pay as you go folk"? I mean anyone who's ANYONE is on a digital cell right? How many folks here on the NG have analog cell??

I don't think it's all from complaints..I think they have a "volunteer"
group of self appointed regulators that pick and choose, because after I had
an auction dumped, I brought several BLATANTLY advertised illegal HF radios,
incuding 2 with 11M -specific crystal controlled bands added, to their
attention, and got a form letter with links telling me they didn't see any
problem....

Ok hotshot;

You clearly mentioned listening between 870~890 MHZ with a PRO-90, or any new scanner.
Name just ONE model of NEW scanner, (BRAND & MODEL #) that comes from the factory for sale in the USA, to the general public, that receives signals in the cell bands, 823.980~849.020 MHZ and 868.980~894.020 MHZ.

I've looked up Boston Hts, and all I see are an old low-band FD frequency, and a half dozen "local" frequencies labeled with Hudson and/or Macedonia (the two adjacent communities). No apparent current FD or PD frequencies for Boston Hts. specifically.

Are they dual-dispatched with an adjacent community? I know Hudson and Macedonia share a fire frequency.

Thanks for any help...

Mike

The Faggot of Mackey keeps coming back for more after getting
effortlessly and repeatedly pounded into the ground.
What makes him come back for more?
He knows he is losing this battle and has no chance of winning.
He reminds me of this poor kid in Jr. High who had a small penis and
was mercilessly teased in the lockerroom. But that kid kept fighting
back and made things worse for himself instead of kissing ass (like
Mackey should)
I didn't participate in the teasing of this kid.
I think mackey should apologize to everyone and slither away like
the loser coward he is. And move to another country for 20 years
until we forget about him.

Gee, it is illegal to divulge what you hear over the radio
from private parties. Sure you can talk about government
transmissions, but not private parties. Doesn't the ECPA
mean anything to you? Did the ham radio operators receive a
written blanket waiver from Janet Reno to divulge what they
hear to the police?

I would hate for someone to get sued and lose their home
for violating the civil rights of people. Give me a lawyer
and I'm sure he can make a case in court to sue your butt
for violating the crooks civil rights.

Leave this to the police and the FCC. It is their problem
and they are not transmitting in the Ham bands anyway.

I knew about the jacks :) And I did use a different charger. Stranger still, the batteries work in my cassette recorder fine, just not my scanner. So right now I am using akalines until I figure this mystery out.

Never Mind this is supposed to be on the ham bands, that
would be better to include then just a general statement
about listening to frequencies.

I would put it all under delusions of importance that some hams
seem to pick up. Others, of course, do not.

My own theory is that the escapees are probably communicating
in newsgroups and avoiding the radio entirely.

Well Keith,

If you would CAREFULLY read the message -- you'll see that the Texas Department of Public Safety has specifically ASKED for help from hams and enthusiasts....

Therefore, if leaving this up to the police and the FCC was NOT the intention of the Department of Public safety.

If you are afraid of being sued for violating a criminals civil rights, don't participate in the request!

I think it would be prudent to get that in writing and have it signed by the Governor.

> Get caught with a scanner in your car and see how fast they say thank
> you.

You bring up a very good point. If you get caught scanning, try to tell the officer you were scanning for the escapees - they will give you a sobriety test in two seconds flat.

If criminal activity is the target of the scanning process, can I scan all cordless and cell phones in my community and turn people in at any time without being prosecuted myself? Or is this just "selective" repeal! Where do you draw the line? Murders and similar crimes happen all over the country every day. I do not mean to minimize the tragedy of the shooting of an officer (or anyone else for that matter), but the government saw fit to enact those laws banning our actions and now all of a sudden it is OK?

Time for me to get off my soapbox.

The ORIGINAL message askes for you to report messages heard over the ham band, the buissness radio service and the Family Radio Service. I 'm not sure the original message states the department of public saftey asked anything, it justs gives a phone number that was possibly found on the TV.

I'd have to say that you're right, but for the wrong reason.

It is a violation of U.S. and Canadian federal law to divulge most two-way radio traffic. It has nothing whatsoever to do with violating anyone's rights. A private citizen cannot by definition violate the civil or constitutional rights of another. They can only commit a crime or a tort against them.

Given that, a private citizen who overhears criminal activity taking place via two-way radio and reports same to the authorities COULD be prosecuted for violating the law (unlikely under the circumstances), or they COULD be sued civilly for eavesdropping on a "private" radio conversation (also unlikely, but lawyers seem to take just about anything these days). However, they cannot be held accountable in any fashion for violating the radio user's civil rights.

Ok...I'll play your stupid game for a second....
The "Texas Seven" (tm) get overheard plotting the big Wallmart takeover in Demming. Charlie Jackson 78 years old hears the bad guys staging on 154.600. Charlie calls his sheriff son and all the bad guys get caught. Case closed.

The media will focus on the old man...who cares about the laws. The bad guys get caught...and there are NO issues with search warrants seeing that they all are escaped convicts.

The so war era law about divulging is going to help the convicts how???

561. Old Uniden base antenna connection?

Newsgroup: rec.radio.scanner
Date: 2001-01-07 02:50:52 UTC
From: monte.carroll@nashville.com
Message-ID: <3a57d722.46329300@news.nashville.com>
Source record: 72660

My brother recently dusted off his old Uniden base scanner and I've volunteered to build an external antenna for him. Problem is I don't know what type of connection it uses nor do I know the model (he didn't have the scanner handy when I talked with him this evening) but said it is a 16 channel base unit, about 10 years old. He also said the antenna connection just sticks in, no screwing or twisting. Sounds like it could be the same as my car antenna connector (Motorola?). Does anyone know what it is? Thanks for your help.

Here is part of the original post:
>The radios are said to include Amateur Radio 2-meter H-Ts
>as well as Business Radio Service (programmed for 156.400 MHz) and Family
>Radio Service (462.5625-467.7125 MHz) radios.
>Hams have been asked to monitor these bands and report any suspicious
>activity - (Huntsville Command Center)

Maybe they are trying to trick us into doing something illegal? I think the chances of that are very small and believe they are sincere in their request. However, federal law being what it is - preempting state and local law - I would err on the side of caution.
If they are *really* serious in their request for our help, they should petition congress to lift the ban.
Hey, I want to see these guys caught just as much as everyone else but it is a double edge sword if done this way.

Lost my antenna for the Bearcat 300 (three hundred), 1979 model. Its a
screw in - size is unkown.
Please email infor. Any thanks.

564. Auto Battery FAQ

Newsgroup: rec.radio.scanner
Date: 2001-01-07 03:02:58 UTC
From: Crane <mfranken@aol.com>
Message-ID: <C%Q56.10198$zH4.495217@newsread1.prod.itd.earthlink.net>
Source record: 72662
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.misc,rec.radio.scanner,rec.radio.shortwave

Found this post in another NG. As hams we often operate Transmitters which could draw 8-15 amps (or more..) under intermittent duty cycles. This faq (see links at end) are an excellent resource on the proper care of auto and truck batteries and charging systems.

------------ cut ------------

The latest revision, 3.0 dated January 1, 2001, of the Car Battery FAQ has just been posted. It covers the following questions:

1. WHAT IS THE BOTTOM LINE?
2. WHY BOTHER?
3. HOW DO I PERFORM PREVENTATIVE MAINTENANCE?
4. HOW DO I TEST A BATTERY?
5. HOW DO I KNOW IF THE CHARGING SYSTEM IS OK?
6. HOW DO I JUMP START MY CAR?
7. WHAT DO I LOOK FOR IN BUYING A NEW BATTERY?
8. HOW DO I INSTALL A NEW BATTERY?
9. HOW DO I RECHARGE MY BATTERY?
10. WHAT IS PARASITIC LOAD?
11. HOW CAN I INCREASE THE LIFE OF MY BATTERY?
12. WHAT ARE THE MOST COMMON CAUSES OF PREMATURE BATTERY FAILURES?
13. HOW CAN I STORE BATTERIES?
14. WHAT ARE THE MYTHS ABOUT BATTERIES?
15. WHERE CAN I FIND MORE INFO ON BATTERIES?

If you would like a free copy of the Car Battery FAQ, you can find it at http://nyquist.ee.ualberta.ca/~schmaus/batfaq.html

If you would like the latest Deep Cycle Battery FAQ, it is posted at http://nyquist.ee.ualberta.ca/~schmaus/dcbat.html

This is just a guess! I would guess that it's a lower end model and doesn't have a connector for an external antenna. "sticks in" sounds like to me it's like an older Radio Shack model where the whip just screws in. Just a guess.

davidpin@pobox.com:

TOM REILLY ADMITS BLUNDERS REGARDING ACCESS TO PUBLIC RECORDS
(APOLOGIZES ONLY TO MEDIA)

Attorney General Tom Reilly in Massachusetts apologized to the media
fatcats for denying media access to public information. The report
does not indicate whether or not Reilly made any effort to apologize
to the more violated public in general, or means to limit the scope of
his lament to corporate newsgathering entities who typically digest
and re-distribute otherwise free information for profit. Ohhh okay, I
like the media when the media likes me. :)

http://www.townonline.com/northwest/burlington/news/newALReilly_0104_9.html

ABC NEWS REPORT MYSTIFIES COMMON POLICE SCANNERS IN TEXAS HOUDINI GANG

This article concentrates more on the Texas Houdini Gang's use of
police scanners. An entire section is devoted to the speculation that
this organized group of convicted criminals is using scanners to keep
one step ahead of the law. Contrary to the comments made in this
report which would seem to mystify the source and presence of police
frequencies, the publishing of police frequencies is public in most if
not every state, not "some", and the publishing of police frequencies
is abundant, not infrequent, on the web. In fact, some police
departments post these frequencies themselves in recognition of the
public benefit aspects.

As far as I know, there is no law against mobile scanners in Texas. In fact, I had a nice conversation with a Texas DPS trooper one time about radios and scanners. I-35 just south of Gainesville was blocked by a by a auto-semi accident, they were stopping traffic to allow a medi-flight to land. The trooper came up to my car, said he saw all the antennas, and asked if I had a scanner, 'cause he was looking to buy one for his own use and wanted some feedback from people who were using them already. I made some suggestions, he thanked me and went on about his business. He, at least, wasn't concerned about me having it in my car.

Occasionally, I use one of the TV preamps that you can get at RS. Very noisy, though. Mine work well when tuning manually, but won't allow my scanners to scan due to the high noise level.

I bought my VR-500 last May and have not had a lot of time to fuss with it yet, believe it or not. My opinion, so far, is that I have a very good handheld wideband receiver. It's a little tough to program, and I can't seem to remember the procedures from one day to the next, but I'm sure I'll figure it out with a little more practice.
I use a telescoping whip antenna with mine as its almost totally deaf with the duckie Yaesu supplied.
I wish it had a little stronger audio, but I'm used to that as I've owned an AR-1000 since 1991.
Hope this helps some. Mike

Don't you kow by now that you can't speak out against Mr. Wells or any of his dealers that have bought him out?
They pay his bills and give him free scanners......so what makes you think you can say bad things about them and get away with it? Rich must protect his best interest and keep all his suppliers happy with good reviews and kind words of encouragement or the free radios will dry up! Just bite your lip and go sign the guest book so he will have another one to add to the 100,000 "Accolades ". That arm is not sore enough from patting himself on the back yet.

Rich GOD....you nothing!

Hey....but he gets over 3200 hits a day!

You should learn something about the law before commenting on legal issues.

The "war era law" is still the law of the land.

Escaped convicts do have some Fourth Amendment rights. They can probably be arrested without a warrant in any jurisdiction, but a wiretap warrant is still required for those types of radio communications covered under ECPA.

A warrant, of course, only authorizes THE GOVERNMENT to eavesdrop. The general public would still be committing a crime by eavesdropping on any radio service covered by either ECPA or the Communications Act's privacy section, and there is no way for a private citizen to obtain a warrant.

Drom Australia

Drug seizure highlights new era in police work*

The New South Wales Police Minister Paul Whelan says the seizure of 100-thousand ecstasy tablets in Sydney highlights a new era in federal and state police cooperation. New South Wales and federal police established a joint taskforce to locate the 34 kilograms of ecstasy hidden in computer equipment flown from Malaysia. Two men appeared in Parramatta Local Court yesterday charged with drug offences. Mr Whelan says while cooperation between the two police services did not always exist, it is now at an unprecedented level. The Minister believes the establishment of a DNA database within six to 12 months will add to inter-agency cooperation.

I could be wrong but I thought if you broke the law to stop another crime, you have also committed a crime and can be punished as well. I know if lives are in imminent danger and you
come to the rescue, chances are nobody is going to say anything about what you did. If on the
other hand I go into NYC and buy an ounce of cocaine and turn it into the cops, I am going to
be there for a while until the bail bondsman comes and gets me out. I think you need clear definitive written permission from a government agency, not just hearsay from the news media.

Yeah, Whistle Blower, it takes a real brave man (?) to hide behind a fake name and email address, then take cheap shots at other people. That's all right, the rest of us will give your opinions all the credit they deserve - NONE! Maybe if you had the guts to stand behind your comments instead of hiding behind your "handle" the rest of us would have a little respect for them.

Why are these so high? $30 for a defective part that dims with use! And not a slip in easy replacement either! GRE really screwed up on these EL panels, I replaced the BULB in my UNIDEN scanner pro 2030 for about $3 and it took 5 minutes, and the display is always MUCH brighter, doesn't dim with use. Thanks, I feel much better now.

Very Weak
And the answer is:

The highest license class is Advanced. Under the new regime, the Extra class license has been reduced to a mere 5 wpm morse code requirement. With the introduction of so called "welfare Extras", the Advanced class license has taken the lead due to the fact that it retained some dignity.
Here's an example to help you understand: a test candidate who possesses a Technician class license (with no code) wishes to upgrade to General. He is automatically given credit for the minimum requirements for the Technician license. Likewise, an Extra class ham is now given credit for the minimum requirements for his license, or 5 wpm morse code. Since Advanced hams were required to demonstrate proficiency at 13 wpm code, their minimum requirements surpass those of the "welfare Extras".

Please note that many Advanced class hams passed 20 wpm examinations, but elected to remain at the Advanced level in anticipation of holding the highest license class after April 15.

I have the advanced class license.

Beside the fact that this discussion is off-topic for rec.radio.SCANNER, it
is also bullshit.

I have an Extra Class license for which I had to pass a 20wpm code test (at
the FCC office in Buffalo, NY in 1984). My "requirements" did not change
with the new rules. There is no way to "un-take" a code exam already
passed.

I am trying to decide which scanner to get to replace my old handheld (BC200XLT).

I am looking for something that has no frequency gaps, so that I can pick up Military aviation, among other things. I would like a fast scan and search. Something on the small size would be nice, since I want to take it with me when I travel in Europe. I would like to have something that will take either rechargeable or Alkaline batteries. I want the Alkaline option for when I need to use it now, but don't have it charged up.

Thanks

Billy

Understand that any new extra class license is now comprimised by the fact that you only need 5 wpm and anyone in the old advanced class had to do 13 wpm., so people may wonder about your abilities in CW.

I sure don't know John...seeing we are professionals and not amateurs. We have no desire or need for an amatuer radio license. I have no clue what we(I) would do with one and I doubt Bud needs one because we operate on closed radio systems in both countrys.

But Humor us anyway John...

You can get down to 25 mhz, including CB radio, you can change the mode to AM, FM, or WFM for any frequency, you can preprogram 10 different limit searches, you can store 400 channels, you can lockout unwanted channels, and you have a button to review those locked out channels so you can periodically un lock them, you can change the step size between frequencies, and change the speed, and add delay for a 2 second delay, you can reset all the channels at once with a button on the back, you can reduce intermod with a switch that reduces the signals coming in the antenna, it has a 3 inch speaker that sounds great, the only frequencies you miss are 520 to 760 after you cut one wire to unblock cellular gaps, plus you can do direct searches and set a priority channel and use the monitor button to store a frequency in one of the 10 monitor channels. You get headphone jack on the front, external speaker jack on the rear, and tape output on the rear. It has a built in AC power convertor and a cord attached for AC, and a jack for external power so you can plug it into your car at 13.8 volts. It has a 9 volt battery in a little compartment on the back to keep all your channels programmed when unplugged. Plus there are many mods you can do, including computer interfaces to trunk track. There are many websites just for this scanner. It was basically loaded with everything, and the price when it came out in 1991 was a whopping $600!

Whow, how crappy can you get on usenet? Rich sets the example for all of us with his site--a truckload of scanners wouldn't pay him for the time he has put into it, and if you just read the information on his site, he has a real job so he can buy whatever scanner he wants to without providing all the different features of his site, which includes the feature of cutting the crap out, unlike this newsgroup....

USENET, wrote:

>Can some one tell me WHY I would want to purchase a Pro-2006. I understand they
>are excellent, but what makes that so?

I asked the same questions, and got the answers you gotten. Thought
it might be overstating the case, but what the heck, they go really
well on eBay--if I didn't like it, it'd be easy to get rid of.

So I got one from Ebay, in excellent shape--original box, manual,
antenna all there. The backlight is a little dim, but I've got a
friend who can take care of that at the appropriate time.

You may have my PRO-2006, like my gun, when you pry it from my cold,
dead fingers. The only thing it doesn't do is trunking, and I have a
PRO-91 that does that just fine. So now I can listen to the local PD
on trunking, and everyone else on the 2006.

Expect to pay as much as $300 for a good one. I got lucky and got
mine for considerably less.

Does anyone have any guidelines for how long a good quality antenna cable can be before it is "too long"? I want to put up an external antenna, but I listen to the scanners in both my workshop and my house. The idea is to put the antenna at the workshop, and then to extend the cable to the house, 125-150' away.

Also, how does one hook up multiple scanners to the same antenna? Tee off the line to the scanner, or put the tee on the scanner, a la thinwire Ethernet?

Thanks.

You fail the test, Toilet Boy. You are a liar. That also means your
trite statement "I have never told a lie in my entire adult life,"
is also a lie.

Since I'm anticipating you'll more than likely say "present your proof
within 48 hours or be found a liar by default," here is your proof.
Twenty six times you have identified yourself as "The infamous KSOF."

Toilet Boy, you are STILL a liar and a fraud.

You get sadder and sadder each time you repeat this trite phrase, Toilet
Boy. No matter how many times you repeat it, no one believes you. The
fact
that you are a liar and a fraud has been proven many times and will in
all probability continue to be proven each time you lie anew.

Richard - You have STILL not presented proof of my having identified myself as "The infamous KS0F". What you did present was me identifying as "The infamous KSOF" which is different from your question which was "Have you, John Mackey, ever identified yourself using the phrase "The Infamous KS0F"". NOTICE, the difference here, you asked if I had identified using a "0" (zero) in my call, but when using a similar, but distinctly
different phrase, I always used a "O" (the alphetic letter).

You have only proven YOURSELF to be either a liar or grossly ingorant of the facts. Which is it?

Do you need to be counseled on the difference between the "0" (zero) & the "O" aphabetic character?

Do you need a trunking radio? As for the UK, you may be able to get a
good price and may not have to pay the Vat tax.

Some areas are now digital. So you won't be able to listen to cell
phones with any radio.

Yupiteru is a good brand.

They have a 7300 which is small, but I never used it.

The 7100 and 9000 are good radios.
Both a a 2 second delay which you can't get rid of.
The 7100 doesn't have 30 KHz steps, but is cheaper.

The UBC 3000 by Uniden is pretty cheap, but has those exspensive ($50)
battery packs. Make sure you ask for the 30 Khz mod if you order this
radio,

AOR: I don't care for these.

It's a 200 ch. scanner. With a pretty easy mod it will accept cellular. Just about all scanners will receive portable phones. With the exception of a battery problem, I love my 200xlt.

A band like 140-144 or the one after the air band sometimes have
transmissions with both AM and FM radios. Some scanners don't let you
choose and only give you FM signals. If a AM transmission is picked
up by a FM only radio in that band, you're SOL!
WFM gives you the ability to hear FM radio and TV stations.

>And why would I want to......> reduce intermod with
>>a switch that reduces the signals coming in the antenna,
>

A better word would have been interference. This switch attenuates
the radio by 10 decibles and gets rid of a very power signal that will
give your radio undesirable operation.

I stand corrected, but so do you. The FCC's Code Of Federal Regulations,
Title 47, Part 15.9 prohibits
"eavesdropping" on any communications with virtually any device ,including
scanning receivers,
by anyone not in law enforcement or one of the principal parties to the
original communication

This apparently prohibits all of us listening to anything with scanners. You
go read it and see how you interpret it.

The display is OK,I can program the frequensies,the audio is OK
then I turn the squelch clockwise,but it does not receive any stations.
The PLL unit dont get any clock pulses and no data pulses from the CPU.
I turned in to service-mode by pressing 2,9 and scan simultaneously as
it says in the manual,but I cant get it back into normal mode,how shall
I do?

From start the scanner was completley dead,but I did change two
capacitors on 100 microfarad,and earlier I have changed the transistor Q
201.

I dont think the CPU is defective because everything else but the
PLL-unit
operates normal.

Grateful for some servicetips.

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1206595335

This auction is for a Regency Monitoradio/Scanner, model ACT-R 10 H/L/U.
Physical condition is a 9 out of a 10. This is a crystal controlled scanner
with 10 channels. It has red lights that flash from left to right to indicate
which channel is being scanned. There are two included antennas that screw into
the top of the scanner and there are two jacks for antennas - one for VHF and
one for UHF. The installed crystals work - they are frequencies used in my
area. I can't guarentee how many of the others work with this scanner.
Currently installed in the radio are the following crystals: 154.280, 155.100,
155.070, 155.610, 146.940, 146.580, 154.890, 460.425. Also included are:
155.790, 460.320, 158.250, 146.850, 146.250, 453.525, 156.090, 147.300,
146.550, 158.895, 146.070, 147.190, 153.995, 155.835, 154.995, 159.030,
453.925, 158.970, 122.700, 154.010. 0

At the risk of sounding like an AOL me-too-er, Rich's site is
first-rate. I knew almost nothing about scanning, but I subscribed to
this NG, found a reference to Strong Signals, perused some articles,
and was ready to go right out and buy a scanner, which I've been very
happy with. Rich is Da Man.

Urb

an Icom IC-R1 covers ALL freqs between 100kc (yes kc)
and 1300 MHZ ... with NO gaps. They are available on
eBay for less than $170 USD. They have all the available
step ranges and are VERY tiny in size. (fits in your
shirt pocket) An excellent radio for the price. Long
life " extended " battery packs , leather covers , drop-in
chargers, and multiple antennae are often included in this price.

I have a Winradio 1500e. I have the Digital Suite along with that.
I am interested in knowing how I can test that the data signal on the
Winradio that is connected to the line in plug on my soundcard is
functioning properly.

What about any tests independently of the Winradio to ascertain that
the soundcard line in is working properly? Line out to the speakers
works just fine.

TRY THIS:
go to www.radioshack.com
enter pro-2006 in the search box
click on "detailed parts list"
scroll down until you find the
service manual -- order # MS2000145
you can order by phone at 1-800-843-7422
or you can go to a Radio Shack store to order.

They also have a copy of the users manual.
order # mu2000145

Bill,
Put an antenna on your house. 125-150 feet is way to far for ANY type of coax unless you put some serious amplification at the antenna end, which will also amplify the noise picked up, then you have to add some pretty expensive filtering. Not worth it. As for multiple scanners, I'd recommend a TV coax splitter. You want to make sure it's a broadband splitter for TV antennas, 50-900 MHz. The splitters for CATV generally only go to 500 MHz. Forget the tee, that won't work well at all.

I believe that this was a generalization referring to the most common type of portable phone, operationg in the 49 mhz. or thereabouts range. Of course, there are 800-900-1.2ghz and off into Oz spectrum cordless stuff on the market now, all designed to keep us EEE-vil scanner folks from listening to cheating housewives and siding salesman calls.

The cited section refers to the use of low power transmiters as
listening devices, i.e. 'bugs'. The FCC does not (currently) have
jurisdiction over the use of receivers.

urei@aol.com (Urei) also wrote:
>> Listening to cordless and/or cellular transmissions is illegal in the
>> United States.
> Actually, No, it isn't.

Actually, it is.

The following is a dissertation on the various laws and their effect.

The laws of the United States, passed by Congress, are codified as
the United States Code (USC). It is divided into titles covering various
subjects. Title 18 includes the criminal laws and penalties; Title 47
covers telecommunications. A law can be refered to by its original name
(i.e. "The Communication Act of 1934") or its entry in the USC. A specific
section would be refered to by title/USC/part/section, i.e. 47 USC 605.
To carry out the law, government agencies create regulations, which are
codified as the Code of Federal Regulations (CFR). It is likewise divided
into titles, with the FCC's rules in 47 CFR.

18 USC 119 bars the disclosure of any electronic communications to
which you are not a party (with certain legal exceptions), and sets the
penalties. 47 USC 605 (the Communications Act of 1934) also bans the
disclosure or use of third-party communications. With minor changes, this
has been the law for 65 years.

In 1986 Congress passed the Electronic Communications Privacy Act (the
ECPA), which added definitions to the law that banned listening to cellular
telephones. It also banned the monitoring of broadcast auxiliary, SCA and
scrambled signals.

In 1992 Congress passed the Telephone Disclosure and Dispute Resolution
Act (TDDRA), which instructed the FCC to ban the manufacture or import of
scanners capable of receiving cellular. In accordance with this law, the
FCC modified 47 CFR Parts 2 & 15, effective 26 April 1993. Note that this
does not affect the sale of such scanners, so long as they were made or

imported before the cutoff date.

On 25 Oct 94, the Digital Telephony act was signed. Buried in one of the additional sections was a change to 18 USC 2510 & 2511 that added cordless phones to the original ECPA ban on receiving cellular.

In April 99 the FCC revised 47 CFR 15.121 so that any cellular mod, even to one's own or a pre-ban scanner, constitutes manufacture. They also required manufacturers to make the tuning and control components inaccessible, and limited the reception of cellular images.

In short, it is illegal to:
Manufacture or import cellular-capable scanners;
Modify a scanner for cellular reception;
Listen to cellular (and cordless) transmissions;
Divulge any communication to which you are not a party.

Pogo, Pogo, Pogo,

People like you never learn. I know because I lived with one for 16 years. Your pal posted your apology on Rich's board. Odd that a moneygrubber and people hater like rich would allow that huh?

As your pal mentioned you were drunk when you made some very negative posts. I think the post that was copied here was just the straw that broke the.... Get it?

When alcohol starts affecting your life it's time to get help. I've read some of your posts that seemed O.K., but I've also read some that I thought were insulting and annoying. I think I even replied to one asking Rich why he put up with your crap. I can't recall more then two people ever annoying me on that board and you were one of them.

I don't know you and I don't know Rich, but I do know that I like most of the people on that board and I like the service he provides. I never really liked any of your posts and I don't miss not having you there. Get into a program sport.

Spend some time in a courtroom before you tell me "how it is".

>
>
> The "war era law" is still the law of the land.

No arrest...No convictions ever during peacetime of this lame law. What makes you think the Gubment is going to start enforcing it now?

>
>
> Escaped convicts do have some Fourth Amendment rights. They can probably be
> arrested without a warrant in any jurisdiction, but a wiretap warrant is
> still required for those types of radio communications covered under ECPA.

Moot...If I hear them on the radio their "forth waiver" they received when they were convicted kicks in... Fourth waiver is a condition of sentencing for all 7 of them.

>
> A warrant, of course, only authorizes THE GOVERNMENT to eavesdrop. The
> general public would still be committing a crime by eavesdropping on any
> radio service covered by either ECPA or the Communications Act's privacy
> section, and there is no way for a private citizen to obtain a warrant.

I might commit a crime...but I'm not violating their rights of escaped convicts that have been sentenced...they have no rights....I can shoot them, kick them and take their radios under Texas law.

It really don't matter now does it...cuz the gubment already has obtained wiretap orders on a whole slew of friends and family members known to hang with these guys. The entire wiretap order probably took about an hour to obtain at the most.

Step 1: Open "wiretap orders" file in word 97
Step2: Fill in blanks as requested..
Step3: Sign forms...
Step4: Find on call Magistrate on golf course...
Step 5: Swear out warrant...sign more forms...
Step 6: Go to radio shack for wires to use in "tap".
Step 7: go drinking...

Keep obeying that law.....
I'm getting me some of that 100thou...

Bill,

for hooking up multiple radios to one antenna check out this site:

http://www.stridsberg.com/

As far as going that far with your coax it will cost you some serious loss of reception. I have learned from other guys that if you do intend to go anythng over 25 feet you might want to use RG11u or 9913 coax.

Forget the 9913 and the rest and try some Times Microwave LMR400. Lower losses and lower price. I have no connections with these folks I am just really happy with their cable. Do yourself a favor and look at the specs before you buy.

I myself would just install another antenna. You can't have too many antennas!

The most important part of all--it has triple conversion filter, which means you don't get 9 frequencies in a row that are "data noise" from some microwave signal that is not supposed to be there anyhow.

Don't forget to check the laws overseas. I don't know the specific laws but
I do know that in France for instance, you are presumed guilty, not
innocent. In other words, its up to you to get off, not them to prove you
did it. Make sure that you investigate legalities for foreign nationals,
not just the domestic laws, they can vary significantly.

ROTFLMAO!

Toilet Boy, you are such a moron, still easy to bait, and gullible as
ever. It's becoming less and less of a challenge to prove you a liar.
While you've been whining about the difference between O and 0 (a trap
I deftly set for you), you've admitted using the term "infamous" to
describe yourself. The definition of infamous is having an evil
reputation brought about by something grossly criminal and disgraceful.
That's somebody, like you Toilet Boy, who is a liar, fraud, and who
illegally sells Amateur Extra Class Licenses to Novices.

You're STILL a liar and a fraud, Toilet Boy, and you keep proving it
day after day after day.

You can't even get that right, Toilet Boy. It's abuse@gblx.net. Make
sure you spell my name right!

> When asked to provide any shread of proof, you & others have only provided
> made up lies that are NOT verifiable.

Only the voices in your head won't accept the REAL truth about yourself,
Toilet Boy. Each time the proof is presented and you deny it, you look
more and more like the pathetic and sad idiot that you are.

The only reason you continue to deny the existence of proof of your
prevarication is you crave the attention. You have such a low
self-esteem that you must do anything to get attention, even if that
attention is negative. That and you get orgasmic at disrupting the
news groups.

Send your complaints about Toilet Boy to: abuse@home.net and
abuse@newsguy.com.

Toilet Boy, The Infamous KSOF wrote:

> I have never told a lie in my entire adult life,

The only way for that statement to be true, you would have to be a
pre-pubescent child and not an adult. Since you are an adult, and I use
that term as loose as linguistically possible, AND you have been proven
a liar, fraud, stalker, and seller of illegal amateur radio licenses,
that statement is a lie.

> & have proven myself to be honest beyond a shadow of a doubt.

Only in your tiny little mind, Toilet Boy.

> YOU, Kendrick, have been proven to be a liar MANY times!

Not by you or any of your schizoid personalities who appear from
time to time.

I would like to suggest that rather than doing major surgery on your
BC 300, that you consider trying it out on a 12 volt power supply.
The AC Power supplies in that vintage of Bearcat (i.e. BC250 & 300) had
marginal filtration at best, and may be interrupting and poor regulation
may be causing the errors.
I personally operate both the old 250 and 300 along with all else on my
desk on 12 volts, and have had no problems for years. When previously
whenever lightning struck within a half mile I'd loose my 250. A
possibly non repairable result.

749. How do I test a discriminator tap?

Newsgroup: rec.radio.scanner
Date: 2001-01-09 03:02:53 UTC
From: netengr@pclink.com
Message-ID: <3a5a7f4f.16181960@news.protocom.com>
Source record: 72548

I just installed a discriminator tap on my scanner (PRO-2006) just for the fun of it, and would like to know if there is an easy way to test if is working properly. I do have access to an oscilloscope, VOM, DTMF decoder, and some other test equipment, if it would be of use to me as a test to see if the tap is working.

Thanks for any advice anyone can offer.

754. PA [Emergency] Situation Report e-mail list

Newsgroup: rec.radio.scanner
Date: 2001-01-09 03:57:26 UTC
From: PA-Sit-Rep <PA_Sit_Rep@yahoo.com>
Message-ID: <93e274$sn5$1@nnrp1.deja.com>
Source record: 72553
Cross-posted to: rec.radio.scanner,alt.radio.scanner

The purpose of PA-Sit-Rep is to keep
all of our e-mail list subscribers
up to date on emergency situations
and activities of MAJOR import
throughout the state of Pennsylvania.

PA-Sit-Rep is a free communications
tool that will enable subscribers
to monitor situations throughout the
State of Pennsylvania including major
weather emergencies, natural disasters,
environmental disasters, police and
military activities (major emergency
events and exercises only), civil
disturbances and political developments
(ONLY OF THE MOST MAJOR IMPORT).

List members are encouraged (but not
required) to send reports to the
list pertaining to any of the above
activities.

The PA-Sit-Rep list is extremely low
volume because posts are limited to
messages pertaining to Pennsylvania
emergency situations only of the most
major import. Additionally, the
message format is set up to support
subscribers using handheld devices,
alphanumeric pagers and text capable
cell phones.

List membership consists entirely of
voluntary participants. We currently
have just over 100 subscribers, but
the more subscribers we have, the more
effective the list becomes. Please
join today and spread the word!

For more information or to subscribe,
please visit the PA-Sit-Rep web page:
http://www.1stpa-militia.org/sit-rep.htm

Or you may subscribe by sending an e-mail
to: pa_sit_rep@yahoo.com

Put the word "Subscribe" in the subject line and the e-mail address you would like to have subscribed in the message body.

It's still discussed as a great scanner, even 10 years after its
introduction.

Durability (except for the backlight)

Easily modifiable with many different types of mods.

High resale value.

Glen,
There may be circumstances in which you are correct, for instance if he runs Andrews 7/8 heliax hardline from a tower tall enough (greater than 60 feet) to clear any nearby hills, into a commercial quality low-noise broadband amplifier feeding a scanner located in a house full of unshielded computers in rooms lighted with florescent lighting. I'll concede the possibility. However, I'm guessing that he is an average new scanner owner who is not familiar with the trade-offs between antenna height and coax loss, and I'm also guessing that he probably isn't likely to spend the kind of money necessary to make the proposed installation work effectively. I might also point out that many ham repeaters (but not all) are located in cabinets on the tower just below the receive antenna to avoid coax line loss. It's just simpler and cheaper to have the antenna located as physically close to the receiver as possible. Special circumstances can change the setup requirements. If the original poster would care to explain his proposed setup, then it might be possible for one of us to give him a more exact answer.

>amplifier feeding a scanner located in a house full of unshielded computers

Don't be silly. There's no need to use hard line or pre-amps. Most
scanners have more than enough sensitivity without one, and any good
quality coax will not attenuate the signal enough to overcome the gain
you will get from having the antenna in the clear. There are all sorts
of factors involved, and no one answer is going to be correct in all
cases, but getting the antenna in the clear is pretty important. Get it
above the roof, at least. I have 100 feet of RG-8 on my ham 440 radio,
and it works just fine.

>also guessing that he probably isn't likely to spend the kind of money
>necessary to make the proposed installation work effectively. I might also

Well, then, he can use the antenna that came with the set, I guess. You
have to start somewhere, and coax loss tables are available all over the
place. Yeah, 3 dB sounds like a lot, but as a practical matter, it
won't make all that much difference except on the marginal signals
anyway.

>point out that many ham repeaters (but not all) are located in cabinets on
>the tower just below the receive antenna to avoid coax line loss.

Oh, crap. I've been involved in a lot of repeaters, and not one of them
has been installed that way. I suppose in flat country where you have
thousand foot towers it makes sense, but we have mountains around here,
and desense and intermod from all the RF on the hilltop sites is far
more of a problem than a bit of coax loss.

> It's just
>simpler and cheaper to have the antenna located as physically close to the

>receiver as possible.

Well, not necessarily, but that's another topic. In any case, some separation is almost always needed, and 50-100 feet of good coax is not that bad if you get the antenna in the clear and up in the air.

Can you hear radio traffic? If yes probably works fine.
If no go to your volume control properties and make sure that the line in is not muted. (9 out 10 it is by default)
Or plug another device into line in, Can you hear it?
Don't forget to check you leads.

$350 max. Look at Ebay for historical data. Indeed these have more
miles than yours..... but I don't think anyone will pay the premium.

YMMV

It is only worth what someone will pay for it. Try to sell it for that
and see how much alot lower you will have to go. I would pay $400 even
for a brand new one. Wanna sell?

777. Trunked Radio Information Homepage Updates

Newsgroup: rec.radio.scanner
Date: 2001-01-09 15:03:18 UTC
From: "Lindsay C. Blanton" <lindsay@lcblanton.com>
Message-ID: <NMF66.1974$To3.351100@nnrp3.sbc.net>
Source record: 72576
Cross-posted to: alt.radio.scanner,rec.radio.scanner

Hi Folks,

The Trunked Radio Information Homepage has been recently updated:

Due to numerous requests from visitors -- I've updated the Trunked Radio Information Discussion Forums with the following new forums and features -->
a.. We've now added Trunked Radio Discussion Forums for all 50 states. This due to the fact that numerous requests were made to the webmaster for discussion forums on a nationwide perspective.
b.. Added For Sale and Wanted forums for Trunked Radio Equipment. Here you can get a nationwide exposure for advertising your trunked radio equipment, as well as exposure for locating hard-to-find trunked equipment items.
The forums are becoming more popular than ever, and are a better alternative to the mailing lists, which can flood your mailbox with unnecessary messages.

The forums also feature the ability to notify you when a topic has been changed, as well as indicating to you which threads have been updated since your last visit.

If anyone has any questions, contact me directly!

Lindsay Blanton

I agree that $400 is outrageous but to say it is a doorstop is just silly. I have a 2004 and it is far from doorstop material. It along with my antique Icom R7000 (you probably consider it a wheel chock) make a fine trunktracker even though the City I live in is still conventional. Both computer control nicely for stops and chocks!

Next time you are stuck with a doorstop like that 2006, send it my way. I can't keep the shack door open in the summer. :-)

It was $600 new, so I guess it should be worth $700 now just because it has 10 years interest! I would say the right person would pay at least $500 for it. Not only does it get frequencies the newer ones can't, it can store 10 different limit searches!

I am after a good quality scan of page 9,10,11 of the Service manual for a Yaesu FRG-9600 receiver. I don't wish to buy one, I just need the pages that describe the re-alignment procedure.

I have read most of this thread about listing to Cell Phones. What do you
do when you don't want to listen. My son has a Gerry Baby Monitor
and when he puts it on his belt and goes outside, it picks up Cell Phones
all the time. Shot the baby or call de Feds?

Message-ID: <qsO66.29309$Bb2.3491538@typhoon.tampabay.rr.com>
Source record: 72452

Anyone have a Pro-2032 manual not needed anymore, or willing to make a copy for a fellow scan-op? I checked the RadioShack site and they do not have it available anymore. My Pro-2032 has been a great scanner but I have forgotten how to use some of its features and need to do a bit of reprogramming.

Thanks

Especially when it shows up on the NG like this, one of the self appointed vigilantes will feel obligated to call it to the staff's attention.....best to just keep a low profile and hope they miss the keywords on the search, or the model number isn't on the "hit" list.

I'm using the AOR AR 8200 right now typing this. Great little radio.
Got it from www.bander.com over the internet for ~$550.00. Looked at
many brands and reviews before picking this one. Seems to be a
wonderful radio. Might be just what you are looking for.

Cheers
Collin

Wow!!

To see a debate about a police department that catered to stopping people on the highway to increase cash flow in the community on the internet!!

I remember growing up in that area (Northfield, Ohio) and getting stopped many times for anything from a mile or so over the speed limit, to too many people in a vehicle (remember that one for a camp fire story). Anyway, I liked listening to the Macedonia, Boston Hts, Hudson and Summit County Sherriff stopping kids just joy ridding around having a good time by Brandywine, Old 8 and so on.....

Still, I remember them also saving a few lives from accidents on the new Route 8...

Just a few thoughts as that area of Ohio gets more populated.....

810. Re: antenna cable length

Newsgroup: rec.radio.scanner
Date: 2001-01-10 02:49:44 UTC
From: Bill Seward <seward@northstate.net>
Message-ID: <72in5t0e7bm9ofbgee5fran5dsj0ka99e9@4ax.com>
Source record: 72459

Bill Seward <seward@northstate.net>, hoping against hope for wisdom
from USENET, wrote:

<original post snipped>

Hm-m, it seems I've opened up a serious can o' worms here.

Based on the advice of some of you, I've looked over some coax loss
tables. Being new at this, I'm assuming lower numbers are better.
OK, so coax isn't coax. At some level I knew that, but I didn't
realize there were such dramatic differences between brands and the
various styles of coax.

I've also given this some thought. Quick outline (as requested by one
reply); tell me if I'm going along the right direction...

I have two scanners, an RS PRO-91, used mostly for trunking the local
PD, and an RS PRO-2006 that does most everything else (At least while
I'm at home. Traveling is a different subject.). While reading the
coax stuff, I also surfed some antenna sites, and I've come to the
conclusion that since I do mostly local 800 Mhz with the PRO-91, the
rubber duckie is probably just fine--I don't really need the external
antenna.

The PRO-2006 is different. Even though it has a nice whip, it would
benefit from an external antenna--that would give me a lot more
signals to listen to, especially if I get the antenna up. In my area,
20' would probably be enough to make a tremendous difference.

I have a discone antenna that I was given (don't know the brand) and
good material to build a 20' guyed mast. I had thought that to keep
from putting up too many antennas around the house (wife
objects-asthetics), I might be able to use one for both areas. I have
commo conduit between the house and the workshop--enough for phone,
CATV and data, with room left over for a run of RG-8/RG-213. (If
necessary, I can free up some extra space in the conduit by forgoing
the CATV.)

Length of the run from antenna through the workshop to my den will be
about 150-160' (I did some careful measuring, and I know the length of
my conduit to the foot).

I don't want to sink too much money into this project--I enjoy
scanning, but it isn't a primary hobby for me.

Any further input is welcome. Just what I've gotten so far has
pointed me to some interesting learning materials--thanks for that.

>other features it comes with.

I beg to differ. The 2006 (or 2042, 2035) have much better audio than
any Uniden scanner. Sensitivity may bounce back and forth between
the different models. The sensitivity of any GRE radio is good enough
for me. The 2006 is pretty good in that area. The selectivity and
intermod is better in the GRE's that I use. Not to mention the squelch
tail is usually terrible on the Unidens. The 780 is improved in this
regard.

As for the gadgets, they don't matter to me. A base model is a model
which I put on and listen throughout a few rooms. I vary rarely ever
look at it, let alone playing with the gadgets. However, gadgets are
nice on a handheld unit.

The Pro 2006 is a classic and a great performer. Every scanner
enthusiest should own one.

The PRO-2006 was never "$600 new." Regular price was $399.99, with frequent
sale price of $349.99.

Just for the record, I did not write any of that. I think Uniden stuff
is crap, and the GRE scanners are far superior in the areas that really
count.

Hi,

I have been thinking about getting a scanner and wanted to get some recommendations. I want to scan aviation frequencies, but would like the flexibility to scan other freqs also. I have no idea what scanners to even look at or their cost. Sounds I get one of the PC controlled units or ,,,?

Any advice is greatly appreciated.

828. Re: NMO mount antennas

Newsgroup: rec.radio.scanner
Date: 2001-01-10 08:17:36 UTC
From: leadenwah@aol.com
Message-ID: <20010110031736.02849.00000498@ng-ci1.aol.com>
Source record: 72478

NMO simply means a watertight through sheetmetal antenna mount requiring a 3/4inch hole The mount in turn accepts a very wide variety of antennas which are threaded to fit that mount.

Larsen used the time for one of their lines for years. It is also known as a " Motorola " mount. These are usually mounted through the vehicle roof, trunk lid, even the tops of the rear fenders.

Almost all of the VHF and UHF antennas on police cars used the NMO type mount.

829. what became of MESSAGE TRACKER ???

Newsgroup: rec.radio.scanner
Date: 2001-01-10 08:23:30 UTC
From: leadenwah@aol.com
Message-ID: <20010110032330.02849.00000499@ng-ci1.aol.com>
Source record: 72479

Does anyone know what became of MESSAGE TRACKER ? The hardware simply connected from the scanner's audio jack and fed to the computer's Serial port via a small module. Software allowed the reading of paged messges if I recall correctly ?

Is this still around?

Geo.

Source record: 72481
Cross-posted to: rec.radio.scanner,rec.radio.shortwave

Hi

I am considering a purchase of one of these two radios. I may also consider the Icom R-8500. I have read some early comments on the VR-5000 that seem to indicate that it is going to be a nice unit for the money. However, while I am not a super serious DXer, I want a *nice* radio. The AOR 5000+3 is a good $1000+ more expensive than the VR-5000. From owners of the new VR-5000 that either have had experiences (maybe own) an AOR 5000+3 (I guess the AOR 5000 also would count), I am hoping to get some idea of how the VR-5000 stacks up for $1000 less. :-) Does the AOR have $1000 more worth of features/quality than the new VR-5000??????
If you think it does, then can you elaborate?

I certainly would rather spend $1000 less on a new radio, but not if the $1000 is throwing my money away! Likewise, I don't want to spend $1000 more if for $1000 less I can get something that would (for all practical purposes) more than make the grade!

This decision was MUCH easier when trying to decide between the Icom R-8500 and the AOR 5000(+3)! :-) I think I would have opted for the AOR based on what I had read here on USENET.

Thanks much!

Mark

This scanner rules!!!! I don't moniter trunked systems so I can't speak on that subject, but for conventional scanning this thing rocks. I'm using mine as a mobile unit with a glass mount antenna. Before I received my 780 I was thinking that i would need to upgrade my antenna and my cable to get an decent reception. WRONG!!! This unit picks up everything with little effort. I now have to attenuate some freqs I used to struggle to hear. I was using a Pro 92A and a BCT7. I had the BCT7 hooked up to the same antenna as my 780 is now.

It's a whole new hobby to me now.

Hoping to travel to beautiful south Texas soon, looking for Kingsville NAS and area Air to Air tac stuff, especially pilot training stuff. Was down there about 7 years ago and found quite a few Pilot training, CGA and air to air stuff at Kingsville which were not published freqs. Of course, lost my list, and most have probably changed since then. Also interested in any ADIZ / Customs / INS stuff down that way. Please respond via e-mail if you can add anything. If you are near Kingsville NAS I highly suggest running some searches through 225-400 Mhz, it's a very busy place. King ranch and associated museum tours were also very cool, though not radio-wise. Here's what my research has turned up so far:

Heh -- well, awhile back, I did a little poking around and found that
according to the Columbus Dispatch, there are 27 municipalities in
Ohio that take in more revenue from speeding fines than from taxes.

I am not making this up.

I have a AOR5000+3B.
Great radio and its fairly easy to block and unblock too where you get full
5Khz to 2.6Ghz coverage which people deserve if they buy such an extreme range
receiver in the multithousand dollar area. There is an AOR5000 e-group on e-groups
somewhere but don't have the URL handy. You won't be disappointed but you will want
to get yourself at least a noise reduction program for your PC to use with your radio and
soundcard as you will need noise reduction no matter what radio you choose.
I now use a Timewave Noise and tone reduction outboard unit. Works like a charm and doubles
as a great outboard TTY and general radio to FSK/digital converter for when you get bored
of voice and want to decode all those cools beeping and warbling sounds out there.
You choice just depends on how wide of a range, how much sensitivity and if you want a cool
looking radio or one that outperforms everyone else (that's still in production in the
widest range
receiver you can get without having to pay double.
The AR5000 isn't the prettiest radio or easiest to use though so keep that in mind. It's
front panel
demands that you memorize it or you will find yourself in the dark with the lights out and
not knowing
what buttons to push with the light switch all the way across the room. On the other hand,
its not all about
looks and well layed out buttons but the radio itself, but it would be nice to have both.

What I think is, well I get cell phones, and I'd rank it 45-50% both sides I pick up, probably that the caller on the cell phone is on a digital phone, so we only get the person on the normal phone, or that the caller is on an analog phone, so we hear them but the other person is on a digital cordless phone, so we dont hear them.... Thats just my say

I've had three Uniden scanners. All of them were crap, and were back
for repair several times. Not only that, but Uniden's repair/warrantee
service sucks. And their monopolistic attitude doesn't help, either.

I don't care how many fancy software "features" they add to their junk,
it's still junk. I want solid, dependable performance, not bells and
whistles.

Even Cheek agreed that Uniden scanners were inferior to the Pro-200x
series. I will never buy another Uniden product, no matter how *pretty*
they make them.

Most people think that it is illegal to tell anyone what you hear on a scanner. At least 1 federal court judge seems to disagree.

Please see http://www.afn.org/~jlr/gass1.txt and http://www.afn.org/~jlr/gass2.txt

If you read the first item first, it will help you to understand what was going on.

Xerox copy of this manual is listed as available - on the radio Shack Web
site.
The order number is MU2000409.
You can call 1-800-843-7422 to order, or go to any Radio Shack store.
you can find it at www.radioshack.com enter pro-2032 in the search box,
then click on "detailed parts list" if you scroll down far enough you will
find the manusl.

The MU--- manual is the user manual
the MS--- manual is the service manual.

"Features" are mostly advertising gimmicks. It's basic performance that counts. I'd wager that none of those fancy-schmancy Uniden toys will handle anywhere near the severe RF environment that my 2004 does, and I bet they won't last nearly as long, either. Do they have a metal case, with the sort of internal shielding that the 2004 does? Not bloody likely.

Uniden makes crap. They won't warrantee it properly, either, or at least they didn't with my BC-350, which was the last scanner I'll ever buy from them. It was the most high-priced piece of useless junk I've ever owned. Yeah, it had a lot of "features," too. Too bad it wouldn't play more than a month or two without breaking down.

Too bad Uniden refused to repair it the last time I sent it back, and instead offered me a "discount" on a cheap reconditioned piece of crap that I could have bought brand new from mail order for less money.

At least with Radio Shack, if something doesn't work, I can take it back and exchange it, or get my money back, no questions asked.

Suggestions? Sure RUN OUT AND GET IT!!!!! I got mine from Glenn at www.scannersunlimited.com I called Glenn thinking about buying this unit. I asked many questions. Glenn suggested that he call me back on his dime. WHAT???? Sure. Glenn called me back, answered every question I had and even told me I could save some money if I wanted a lesser unit since I don't moniter any trunked systems. Glenn then took my order for the 780XLT since there was no way I was going for something less then the best. Glenn told me exaclty when I would receive my scanner and even called me the day it shipped. I got it two days later packed like it was the Hope Diamond.

I really can't say enough about Glenn and how well he treated me or aabout how great this unit is. I've heard horror stories from other guys about not getting prepaid units, units arriving broken, Being lied to by sales people.

I don't know Glenn personally nor have I delt with him before, but the guy about as great a business owner as I've ever seen. Glenn didn't have the best price. I bought from him on his reputation alone. I was rewarded ten fold. For all future scanner and radio purchases, I'm going to Scanners Unlimited.

One person has asked what i though about the audio. I have to admit it sucks. I use mine in my truck and the speaker in the unit is not loud enough. I have connected my unit to a casette/CD output thingy and I get the audio through my trucks Infinity speakers. It's so sweet! Once I hard wire the scanner in I will use a radio shack external speaker or a used Motorola speaker. I've heard results with either of these is great.

I'm suprised that some people have questions about how to program this thing. I was entering freqs and alpha tags in 3 minutes. Of course I'm only scanning conventional systems. I can't say regarding trunked. The display is a dream. I love being able to change the channel using either the up and down keys, the manual button, or the VFO dial. This unit is so easy to use I program in freqs at stop lights.

What could improve this unit? Detachable face plate for easy mounting on dash. a remote control. I know I'm dreaming,but someone dreamed up this baby and it's a winner.

actually the way it works from 869 to 894 mhz is you receive the signal from a cell tower and it has both sides of the conversation;
or you receive the signal from the cell tower and it has only one side of the conversation. It is up to the company running the cell tower and equipment, there are several different companies and they do it differently. You noticed a change because some company changed the way they do it, or because some new company came in and sold a lot of cheap airtime, they are selling cell phones in drug stores and at quick cash outlets now, even on TV with ad that says if you lost your phone rights for non-payment, get one of ours! You pre pay your cell time like buying phone time on a card, so the company has no risk from broken down people who would never manage to pay on credit. The call starts, " you have 34 minutes remaining," you can also call in and order more time charged to your credit card. The cell frequencies are there, 850 of them, the towers are there, the companies are there. As long as digital can go higher in frequency, they don't need the old cell frequencies.

I received my VR-5000 last Friday, and have
played with the shortwave on it and have been
very impressed the the performance considering
this is a rather wide band receiever. I also
have a Kenwood R-5000 which I compared it to when
I was playing around with it... very impressed
with the Yaesu... I think it is a keeper! I do
wish that there was some software out there for
it somewhere!

Bill,

One important point to remember is that the higher the frequency, the more loss you will get. This goes for the coax, the foliage and the distance to the transmitter through the air.

If your trying to listen to the 800 signals, try to get your antenna as high as possible. Putting it in the attic of the house is not a bad place to keep the better half of the family happy. Try to keep the coax to the 800 antenna as short as possible. Use a good type to keep the cable loss down.

As for the remainder of the scanning bands, in most cases, it won't be that bad of a problem. The losses are much more acceptable for the 450 and 150 ranges.

Sounds like you need two antennas for the type of monitoring your trying to do. The rubber duck antenna is not much of an antenna at the 800 range. Put a good antenna on the radio and listen to what is really out there.

Jim

Correct. What's happening is the some phones send some of the audio back out with the incoming, thus both sides of the conversation are rebroadcast out the repeater - but sometimes not if the phone mfg. doesn't mix the two. At least that's what I've heard.

Nice radio.

Pro's:

Good sensitivity

Improved squelch tail

Lots of gadgets

Delay- I never thought Uniden would make a radio that would give the
user this much flexability.

Display is nice

I-Call- if your area uses it.

Cons:

The worst audio in a mobile/base that I've ever heard. No true highs
or lows and most things sound "muffled".

Selectivity-- Same as usual.

Trunk Delay-- The radio holds onto the control channel for an entire
second before resuming back to scanning conventionally. Thus slowing
down the scan speed significantly.

Overall: The best Uniden I've ever seen. There's not too many bad
things to say about it. But the audio and 1 second delay really
irratates me. If you got some mobile units who frequencies are near to
each other, it's doubtful if you'll hear them (selectivity). It will
stop on a frequency nearby and just be blurred speech. Example:
155.460 will come through 155.475 and 155.445.

Until GRE gets their act together, this will be the top radio on the
market.

You're listening to the mobile frequency, chump. Listening to cellular phones, IMO, is strictly a loser's game. If you derive pleasure from listening to other folks' personal business, and particularly shortcomings, you really should assess your own life - or lack thereof.

.....and so should you. I've been preaching the virtues of NMO mounts
for as long as I can remember. You don't have to drill a 3/4" hole to
use them. There are NMO mounts available that use a 3/8" hole. I've used
many myself and they are every bit as good as the regular ones. There
are also all sorts of mounting solutions for NMO antennas (trunk,
gutter, mirror, thick plate, adjustable etc). I've seen new NMO mounts
at hamfests for 1$ each - what a deal! The only downside is that they
are not suited to very large antennas. 60" is about the max you can get
away with.

The Communications Act of 1934 made it illegal to divulge or profit from any radio communication not intended for the receiver, with several important exceptions such as broadcast, ham radio, and some public service comms, etc. Since then, various special interests have added all sorts of additions and exceptions, so that it's damn near impossible to know what's strictly legal, as the above cites clearly prove.

Best thing to do is just keep quiet about what you hear, unless you're certain that it's legal to divulge it.

Every way? That's basically impossible. Can it scan ALL of the 800
mHz band? No? Then it's NOt superior in every way.

Does it have a shielded metal case with the circuit boards grounded to
the case? Will it operate in a room full of other radios of all types
without causing interference or being interfered with by any of them?
My 2004 qualifies on all of those points. No Uniden I've tried could
come even close to those specs.

It seems incredible that NMO mounts are not available at Radio Shack. They sell all these scanners for years, and have no NMO mounts. Mobile antennas? In that big catalogue, only one magnet type and one on the window.

NMO stands for "New Motorola" which is a vast improvement over the "old"
style which precluded swapping antenna bases without mangling the coax
center conductor.

Nice clean 2006's are available all the time for $250-275 range. If someone will pay more than the thing cost new, more power to the seller. Bottom line is it's "one" of the best scanners ever made.

As long as you don't live in Maryland, you're probably safe. You
should legally have an FCC license. In Maryland, the Governor, who
is certifiable by many standards, is trying to have bullet proof
vests outlawed. What a nut!

Yes, this is the same man who collected tobacco settlement
funds and wanted to buy school books for Catholic schools,
and the same governor who discouraged any legislation that
allowed slot machines....and he can't seem to realize why
all smokers and gamblers go to Delaware, Virginia, and West
Virginia to buy gas, cigarettes and play slots!

Governor seeks body armor ban
Proposal sparked by city case in which officer was killed; A top
legislative priority; Glendening outlines expected $20 billion
budget for next year

By Jeff Barker
Sun Staff
Originally published Jan 10 2001

Gov. Parris N. Glendening will ask the General Assembly to
restrict the sale and possession of body armor in Maryland,
a decision aides said was influenced by the case of an 18-year-old
accused of killing a Baltimore police officer while wearing a
bullet-resistant vest.

Glendening, who last year won passage of a sweeping gun safety
measure that requires trigger locks, declared the body armor

prohibition a top priority for the annual legislative session
that begins today.

The governor released details of the ban - exceptions would be
made for law enforcement and security personnel - in meetings
with reporters and legislative leaders who began arriving for
the 90-day session.

While Glendening had tipped his hand on most of his budgetary
proposals, the body armor initiative is new. It came as testimony
began in the trial of Eric Darcel Stennett, who is charged with
first-degree murder in the death of Officer Kevon Gavin.
Stennett is accused of deliberately striking Gavin's cruiser
during a chase. Stennett was wearing body armor when he was
pulled from his car, police said.

The case was noted by the City Council when it gave final
approval last spring to a measure prohibiting the sale of
body armor to minors.

Aides said Glendening was influenced by the case, too. The
governor, hoisting a police detective's black vest at a State
House press conference, said he also was influenced by accounts
of the fatal shooting in 1994 of a San Francisco officer by a
man wearing body armor who was shooting wildly at pedestrians
and police. He held off 120 officers for 32 minutes before
being shot to death by police.

The vest the governor used as his prop was once worn by police
Detective David Azur, a member of a regional car theft
investigative team who appeared with Glendening at the news
conference. In July, Azur was shot in the chest at close range
on West North Avenue while wearing it, sustaining a softball-sized
bruise.

"Were he not wearing it, he would not be with us today,"
Glendening said. "Now, when a criminal puts on this same armor,
what you find is that they feel emboldened. Young people feel
invincible.

The vests can cost anywhere from $400 to $1,400.

Hello,

I am new to scanning and just bought a PRO-91. After finding out my old scanner didn't go above 5xx MHz and almost all of the Police stations are on 8xx MHz, I decided to upgrade.

I live in Columbus, OH and want to know if I made a bad decision in purchasing the PRO 91. Some of the posts I have read said it is a great scanner if you live in an area served by Motorola. How would I know this??? Will this scanner not pick up the local PD, Airport, etc???

Also, what the heck is TRUNKTRACKING?? Is this something I need to program or is it automatic?

Last, where can I go on the net and find a good scanning site for beginners? Basically, and Scanning for Dummies would be perfect! :)

Thanks,
Kevin

Well then, check this site: http://www.wa5yti.org/
This is the main repeater system in central Oklahoma. These repeaters are
linked for use during severe weather events, and many of them are
tower-mounted. I'm going up these towers this spring and salvage some
Andrews 1/2" heliax for use at my QTH. All my antennas from 6 meter to 70cm
as well as my scanner antennas will be fed using this. Possibly you live in
a more urban setting, but around here (north central Oklahoma) we have to
squeeze every last db out of a signal. Different areas require different
solutions.

>

If you are only going to put up a 20' mast, consider this idea. Mount the mast on the backside of your house, so that the top of the antenna is below the roof peak when viwed from the street. Your wife might accept that compromise.

> Length of the run from antenna through the workshop to my den will be
> about 150-160' (I did some careful measuring, and I know the length of

If you do decide to run coax through this conduit (I still don't recommend it) try the LMR-400 coax from Times Microwave. Very good specs. And if you do this, consider a much taller mast.
>
> I don't want to sink too much money into this project--I enjoy
> scanning, but it isn't a primary hobby for me.

Yeah, that's the thing with me, my scanner/ham radio setup is VERY serious. If I was married and my wife objected to the antennas, I'd help her pack. (Love me, love my rig.) Springtime in Oklahoma, and I'm trying to pull in a VHF signal from 80-100 miles away to keep track of the storms headed this way. As more linked repeaters come online, tracking the storms has become easier, but better safe than sorry. The May 3rd, 1999 F-5 outbreak that went through Oklahoma City passed about 17 miles west of here. Not very often we get to track tornados via live TV remotes and I'm not counting on that kind of service the next time.
>
> Any further input is welcome. Just what I've gotten so far has
> pointed me to some interesting learning materials--thanks for that.

You have to take the info and shape your own solution, Glen and I have different answers because we have different needs. Like the fine print says on the car commercials "Your mileage may vary".

Good luck,

How on earth do you think they are going to know that you are listening. They ain't going to stop me. They would have one helluva time proving I was listening, even if my scanner was programmed and sitting on a cell freq. By, God, the gov't works for me, not the other way round. If I wanna listen, I don't need their permission or authorization, laws notwithstanding. Just because there is a law for something, do you sheep think you have to obey it, even if it is unjust? But if they wanna listen, they damn well better have my permission and a court order. I refuse to ask the gov't permission to do a damn thing!!!

Hey, suppose they are listening to a rival business spewing it's next quarter's business strategy all over the airwaves? If the dumbasses on cell phones haven't figured out they are on a radio, then they deserve being heard. Besides, if they are so concerned about private phone calls, why do the ignorant asses insist on talking as loudly as possible when I am in a restaurant, thus enabling me to hear half of the conversation anyway? What's next? A stupid law requiring me to wear earplugs, or leaving the room whenever someone whips out a cell phone? Not bloody likely!!

Nonsense. The cell phone repeaters only need to broadcast the base side of the conversation so that the mobile side can hear it. There is no need for the mobile unit to hear his own side of the conversation. The only effect to the mobile station would be that he can't hear his own voice in the earpiece, such as on a conventional wired phone. This effectively means that the cell tower transmitters are only operating half of the time as would be required when broadcasting both sides of a conversation, assuming that both parties are talking 50% of the total connected time. This reduces total transmit time from the repeater amplifiers, thus extending their useful life. It also makes it more difficult to follow both sides of a conversation, because the cell companies know good and well that people are going to be listening, laws notwithstanding.

First off you need to know if your local PD, airport is using motorola system.
Pro 91 does both Trunktracking and conventional.

Trunktracking: follows the frequency as it changes. (Build in)

Here is an apparent example of what a little "interception and divulgence" can accomplish. (This website ?claims to have been beating the media with spot news and accurate weather for 10 years).

Notice that the following item was posted approx 30 minutes after the incident happened.

==========

http://www.jtjm.com/news/kc/kcnews.shtml

..Breaking News...Posted Wednesday January 10, 2001 by JM
JTJM.COM/KC - 0430CST/1030GMT - ... BREAKING NEWS ...
FATALITY FIRE APPEARS TO BE A HOMICIDE

KC,MO ... Two victims have been taken from a burning fourplex in the Northland.
One has apparently died at the scene and the other victim was taken to a hospital with "stab wounds," according to MAST-EMS.

This incident started with the 3:50 am regular-alarm assignment of fire companies sent to "5903 Northeast Parvin Road" at Parvin Estates Townhomes where it was reported one unit in the fourplex was on fire with "people trapped."
Pumper 34 arrives at 3:54 am reporting "smoke showing" and the first of three MAST-EMS units, 159, is right behind them. The first victim is brought out within two minutes ... the second victim about seven minutes later or at 4:04 am.

The first victim is taken emergency by MAST-135 to North KC Hospital. Unit 135 reports this victim "a 45-year-old female stabbed two times in the abdomen with (fire) charring around the lips and nose...." Her condition is described as being very critical.

The second victim ... also a female and found in a back bedroom ... has not been transported as of this report and must be surmised as DOA based on the time inside the burning structure.

There have been no reports of any other bodies found.

Three small streams were reported used on the fire, brought under control by about 4:20 am.

Fire and police arson investigators ... as well as homicide detectives .. were ordered to the scene about two miles west of the World's and Oceans Of Fun amusement park.

The pro-91 works PERFECTLY on the Columbus Ohio system! The Columbus
system also covers the Franklin County sheriff, Columbus, fire and several
suburban police/fire departnemnts. The airport police also are served by
this system.

>
>Also, what the heck is TRUNKTRACKING?? Is this something I need to
>program or is it automatic?

All you need to do is program in the frequencies for the columbus system
(the frequencies are correctly listed in the frequency guide you got with
your scanner) Once properly programmed in, you can let the scanner do its
job.

Greetings,

On the way home from work this morning I heard on a local FM station that the FCC has allocated several new freqs for a nationwide emergency system. There was no mention of the freqs. Has anyone heard anything of this? Are they going to be HF, VHF or UHF or all? Anyone know what they are? Thanks in advance. Stuart

Strangely enough, this hasn't made the FCC webpage.

I'm pretty sure they're referring to common frequencies, to be used to allow
emergency agencies to communicate with each other. And from what I'm
reading, they're in the new 700MHz band, spectrum being removed from
television.

Go ahead, curse at the messenger. It doesn't change anything.

By the way, did you write even one letter of comment to the FCC or to your congressional representation on this subject?

I didn't think so.

I did write letters --quite a few, actually. I even posted them on this very news group several years ago. It seems there weren't too many others who made even a half hearted effort. That's why the law happened. Perhaps a more appropriate person to get angry at is yourself.

I'm sure you've seen the quotes attributed to various people. They all say the same thing: All it takes for evil to triumph is for good men to stand idly by.

So thanks a lot for nothing.

There's bunches of software for the 245!

First of all, there is the excellent FREEWARE created by Senss... Check
here:
http://www.iquebec.com/senss/

Then there is the scanner backup utility, also freeware, located here:
http://members.nbci.com/BC245Backup/

There is also the excellent WINSCAN from Pozilla software, available in
various forms:
http://mghusa.com/pozilla/

Also check out Radio Manager for Windows at:
http://www.interplaza.com/bensware/rm.htm

There are several others, but these should keep you busy for a while..:-)

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1206595335

This auction is for a Regency Monitoradio/Scanner, model ACT-R 10 H/L/U.
Physical condition is a 9 out of a 10. This is a crystal controlled scanner
with 10 channels. It has red lights that flash from left to right to indicate
which channel is being scanned. There are two included antennas that screw into
the top of the scanner and there are two jacks for antennas - one for VHF and
one for UHF. The installed crystals work - they are frequencies used in my
area. I can't guarentee how many of the others work with this scanner.
Currently installed in the radio are the following crystals: 154.280, 155.100,
155.070, 155.610, 146.940, 146.580, 154.890, 460.425. Also included are:
155.790, 460.320, 158.250, 146.850, 146.250, 453.525, 156.090, 147.300,
146.550, 158.895, 146.070, 147.190, 153.995, 155.835, 154.995, 159.030,
453.925, 158.970, 122.700, 154.010.

Well, I have both. It is definately not far superior! There are plusses and minuses with each one. I like the 10 search banks,size,buttons and audio on the 2006. I like the Alpha tags,speed,count,ctcss of the 9000xlt.

936. ***FS/trd: VX-5R with Yaesu case! $250 shipped con US

Newsgroup: rec.radio.scanner
Date: 2001-01-11 20:40:10 UTC
From: John R Alley <chia@korrnet.org>
Message-ID: <93l5naqov3@penn.dii.utk.edu>
Source record: 72533

I have a Yaesu VX-5R that is only about 4 months old that is in perfect shape. The 6m activity here is down and need more power to use. So I thought that I will sell it and get a nice mobile rig. I am interested in a Icom R-10 receiver, and an older dual band HT as a Yaesu FT-530 or maybe Alinco DJ-580/582. I have the box manual and all original stuff with it. And I also have the Yaesu protective case for it. If interested please e-mail me at the address kf4uae@arrl.net and I'll get back to you when I can. I would also consider trades for older HF gear.... like TenTec Triton, etc..etc... If you have something you want to offer... e-mail me and we will see what I can do. Thanks again....

Ft. Wayne, In. and all of Allen County will switch to 800 MHz. I currently listen to them on 155.535 and three other 155 freq. Will this new system be trunked? Will I be able to listen in with a Trunk Tracking radio? Thanks,

FRED

938. FS: Pro-43 with 800 and extras

Newsgroup: rec.radio.scanner
Date: 2001-01-11 21:41:06 UTC
From: pjheller-nospam@west.net
Message-ID: <pjheller-nospam-1101011341060001@pm9-36.sba1.avtel.net>
Source record: 72535

FS: Radio Shack Pro-43 with 800 mod already done. Includes rubber duck antenna, a second telescopic antenna, heavyweight leather case (not the thin case from RS), special RS scanner battery pack with charger (#23-288) in original box, AC adapter and photocopied manual.

Radio is in excellent condition. It has a slight mark on the left hand side where the original owner accidentially touched the plastic with a soldering iron, but it is hardly noticeable and does not affect performance in any way (it is simply a cosmetic flaw).

Asking $250 plus shipping.

Reply to pjheller@west.net or remove no-spam from e-mail address if auto-replying.

just get the Radio Shack website info for the pro-2022. The scanners are almost identical, the 2032 is the improved version with faster speed, but the operation is identical as far as I can tell, these are both great scanners and for the price you can't beat them.

I'm afraid your out of luck. This model had a history of scanning itself into oblivion, as yours did. The fix was to have a chip replaced. By the time mine died, the supply of chips was gone. Darn fine machine for its day while it ran. Built early 70's?
I think this was the first search and store scanner on the market.

The news media apparently just found out what the FCC is planning to do with their TV channels. You know, the ones they have to vacate when HDTV penetrates to 85% of their markets, or the year 2005, whichever is later. This is old news, and it will probably not happen on anywhere near that timeline.

947. FS: SMA-TO-BNC CUSTOM FIT ADAPTERS

Newsgroup: rec.radio.scanner
Date: 2001-01-12 01:32:01 UTC
From: gulyas@netzero.net
Message-ID: <93lmqi$8j8$1@nnrp1.deja.com>
Source record: 72546
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.equipment,rec.radio.swap,rec.radio.scanner

If you have a need for an SMA-TO-BNC antenna adapter that is custom made to fit and protect your H.T. or scanner radio, I have the solution.

Adapter allows you to:
Quickly change antennas to base,mobile or different style use.
Use the more popular and wider selection available of BNC antennas.
Prevent chassis connector wear or from coming loose due to antenna changes.

Adapter features:
Gold plated contacts with a teflon insulator.
A low profile design with a rubber covering for a factory antenna look.
The rubber base seals to the top of the radio with no spacers needed for moisture and dirt protection.
The base also provides an excellent support for any length of antenna or application.
No need to remove adapter once installed to make a quick and safe antenna change.

Sizes to fit radio models:
Yaesu: VX-5,VX-1,FT-50-R,VX-10,VX-150,VX-110,VXA-120
Icom: IC-T8A,IC-T81A,IC-Q7A,IC-R2
Kenwood: TH-D7,TH-G71
Alinco: DJ-V5
Radio Shack: HTX-200,HTX-400,HTX-245
Aor: AR-16

Previewed in the May 2000 Issue of CQ Magazine, and the Nov. 2000 Issue of QST Magazine.

$11.95 + $1.50 S+H(One to unlimited)
(Check or money order only in U.S.Funds)
(Specify radio model when ordering)

STEPHEN G. GULYAS

That's too harsh. The 2004/5/6 (mostly the 5/6) are still regarded as one
of the finest rigs ever made, at least in it's price range ($419 new,
$369 on sale as I recall). I have my original 2005 that I bought in '91
or so right before the '6 came out (since we didn't know if the '6 would
still be able to receive cellular) and I recently bought a '6 in mint
shape (original box) for around $300. I actually bought the '6 instead of
waiting for the 780xlt since I really have no need for trunking (I could
listen to the NJ State Police, but I have little interest).

954. Pawn Shop special.....

Newsgroup: rec.radio.scanner
Date: 2001-01-12 04:09:25 UTC
From: Consigliori <emetib@swbell.net>
Message-ID: <Twv76.183$PG1.149379@nnrp2.sbc.net>
Source record: 72352

Had a recent experience I'd like to share with the group...

As a self confessed Pawn shop junkie I usually spend way more hours than I should cruising the shops looking for hidden bargins. Having a brother who has the same interests as me (radio's and saving money) as well as living in a rather large city (Houston) makes the addiction even harder to resist.

My previous "best find" was a RS Pro-2004 that I picked up for $50.00. The radio worked perfectly and was definately a deal!

Well, I'd rather be lucky than good and that is exactly what I was last week. After eating lunch at the local Taco Bell, I stopped by a PS that I haden't been to in about 6 months or so. Jan, Feb, and March are usually good months to check for bargins due to the number of people who pawn stuff to get Chistmas money.

I walk into the shop and lo and behold there is a PRO-43 sitting in the display case (keep in mind I have looked at literaly hundreds of radios and have never come accross a 43 in a PS). I causally ask the guy behind the counter if I could
look at it. Bad news - radio lights up but half the keys don't work. Good news - I explain to the PS guy that I would like to buy the radio but it is broken - "what is the lowest price you would take" ?

Dude tells me that he can't go lower than $30 - tax included. Needless to say I felt that it was a risk worth taking and the radio went home with me that day.

A quick check on the inet (strongsignals - one helluva site!) informed me that the keyboard problem was well known and even had the part number I needed (Thanks to Bob Parnass). Went to the local Radio Shack and for the grand total of $11.50 the part was on it's way.

Well, I recieved the new keypad today and after about 10 min of work I had a Pro-43 in perfect working condition for the grand total of around $42 bucks.

Deep down I know that I have spent well over the going rate of a working Pro-43 in Gas/time/etc.. in looking for "bargins" but it is kinda like my "other" hobby of fishing - I know it is cheaper to just buy fish from the market - it's the catching part that's so much damn fun!

all the best,
david

In article <936c22ld1@nnrp1.deja.com>,

I am the one who had the "pissing contest" with POGO over a BC 9000XLT.
It went for about 3 posts. no cussing. I got banned forever.
Am curious,,, why I got banned for so long.

Depends on where you are. Some areas of the country use LOTS of LM
mounts. Same 3/4 inch hole, but a mount that uses a positive
connection to the antenna, as opposed to the spring metal of an NMO
style.

We use about 100 LM mounts to 1 NMO, and much fewer problems.

Get yourself a LM mount, and you will NEVER go back to NMO. Heck,
I will even send you one to check out. They work great, and no
intermittent antenna problems like one sees with the spring
metal contact on a NMO.

961. 7 digit codes on a 6 digit scanner

An Eskimo takes his snowblower to the shop for repair. The tech looks at it for about a half an hour, then the tech goes over to the Eskimo to tell him what's wrong with it. He says, "It looks like you blew a seal." The Eskimo replies, "No, it's just snot."

Absolutely. That's only 500 cycles and the automatic fine tuning will
kick in. My scanners take all the digits but I cheat and round up so
I have one less digit to type in. EG: 860.2125 is entered as 860.213.

In a word, Yes. Enter the frequency as given. Your scanner will either display the frequency, dropping the last digit, (463.0875 will display as 463.087), or it will round the frequency off, which will not make a practical difference in reception. My BC-200XLT works the first way, so your 760 probably will also.

(Sorry if this was release already by someone else)
http://www.state.il.us/gov/press/00/dec/1222radio.htm

$25 Million Grant Announced to Build New Public Safety Network
Springfield, IL - Governor George H. Ryan has announced the Illinois FIRST Program will provide $25 million for a new statewide police radio communications system to improve public safety.

The Illinois FIRST grant to the Illinois State Police will purchase new radio equipment to use the new Starcom21 wireless state radio system. The state will lease time on the new network to be constructed by Motorola, the vendor selected after a competitive bid. Starcom 21 will replace the Illinois State Police Department's outdated and inefficient communications network and will allow other public safety agencies to communicate directly via state-of-the-art wireless technology.

"The current system is aging, fragmented and unreliable. With the help of Illinois FIRST, we're able to utilize cutting-edge technology to make sure that public safety agencies have the tools they need to get the job done and protect our citizens," Gov. Ryan said.

Competitive bidding, a multi-state agency review, and an independent third-party evaluation of the bids all recommended Schaumburg-based Motorola implement the Starcom21 system. Motorola has a long history of providing voice communications systems to government agencies and the private sector. Negotiations will now begin on final contract terms.

The new statewide radio system will be phased in over three years. It will be capable of accommodating other federal, state, county and local public safety agencies on the leased network. For the first time Illinois public safety agencies at all levels of government will have the opportunity to participate on a common radio system allowing them to communicate directly.

"Our vision for this new system would make it possible in emergencies for federal, state, county and local police and public safety agencies to communicate directly with each other, and that will save lives," Illinois State Police Director Sam Nolen said.

The new, leased radio system will offer an attractive option to counties and municipalities also faced with aging, outmoded police and public safety radio systems. Those agencies will now be able to participate without the cost of establishing their own radio networks.

"The new radio system will help our police officers who are combating gangs, guns, and drugs and improving highway safety," Gov. Ryan said. "This system will help us serve our citizens more efficiently, and protect our public safety officers."

Has anyone tried the new scanner antenna
shown on http://www.winradio.com/home/ax31b.htm ?
Seems this could be a good antenna to use indoors...

Martin

The red bars correspond to the current scan. The yellow
ones are from previous scans. I guess this means that the red
frequencies are currently active, while the yellow ones are no longer
active.

>I have set the bar height for "Hit Count". What exactly does that
>mean? I have run it continuously. I would expect the bar to get
>higher when it rescanned and found activity on the same frequency.

The maximum bar height is always the same, and corresponds to the
maximum hit count in the band. If there has been no hit on a
particular frequency, the related bar gets "pushed down" by each
subsequent scan, so what you see is the relative relationship of hit
counts of all frequencies in the range at any given time.

>functioning properly.

You should be able to hear the noise. Even it is a "data" output
you will still hear a sound (on FM-N) if you connect this to Line In
on the sound card.

>What about any tests independently of the Winradio to ascertain that
>the soundcard line in is working properly? Line out to the speakers
>works just fine.

Try the analog scope in the Digital Suite. If the Line In is working,
you should see the signal (instead of just a steady line).

Hope this helps

I dropped my PRO-43 a while back. It continued to operate for a while but would randomly switch channels. Now it is completely dead. No display, no sound, nothing.

Anyone have any idea on what to look at? I checked the obvious like power, power switch, seating of daughter cards, etc. I am capable of repairing it if I know what to look for (I replaced the speaker already). If not, can anyone suggest a reputable repair facility?

TIA

Just came from a NPSPAC region 24 (immediately adjoining Ill) meeting
yesterday. The southern Illinois frequency advisor/ NPSPAC chairman
was there and the Motorola engineer responsible for implementation was
there also. I can verify their radio system will be wireless, at least
from the vehicle to the fixed-end equipment.

Anybody on this group live in Las Vegas? I am also a "pawn shop junkie", and have found Vegas to be the best of the best. Desperate, broke gamblers create a need for several pawn shops in and around The Strip. Because the gamblers will pawn for "just enough to win it all back", the shops have less into an item than would otherwise be the case. Since they have such a huge amount of incoming inventory, they sell cheaply in order to insure a quick turnaround on the merchandise.

I went to Vegas last year for 5 days. Spent 2 days in pawn shops and 3 days relaxing. Sold most of the stuff when I got home and made enough to pay for my entire trip...and then some! Free-market capitalism is a great thing, boys and girls!

Source record: 72197

Bearcat 300? I thought I was the only one left in the world still using this scanner. As for a replacement to the screw in whip, I'd try something along the line of a cordless phone extendable antenna, probably from Radio Shack. I had an extra a couple years ago, but probably couldn't find either right now. Still using the Motorola antenna connector on the rear, but have considered replacing it with a chassis mount BNC to eliminate having to use an adapter.

That's one euphemistic way to put it. Brutally murdered is the real
name for it, however. Just the same, the shot that killed him did
not have the desired effect - instead of quelling the outrage and cries
for freedom, they made MLK a martyr and galvanized the whole movement.
In large part, it is the defining seminal event that has brought this
society to where it stands today WET race relations.

For blacks who, despite the Civil War and Emancipation Proclamation and
Consitituional amendments were still subject to obnoxious treatment
under the law, it was the shot heard round the world.

How can a non-animate object commemorate anything? You know,
like 'Traffalger Square'(excuse the spelling), or all those non-
animate statues? I find fault with your logic.

His FBI file was an interesting read!
He was not the "saint" he has been made out to be in the press.....trust me one this one!
NOT one of J. Edgar's favorite people.
HE DID have a valuable message for the people of his time but it is best left that he did more good than bad for race relations.

And as politically incorrect as it sounds, I remember him as a whore hopping preacher who was involved as a tool of the communists.

I marched with him once in Alabama, trying to do my part for equality and was privy to some of the private conversations that went on. I heard remarks from he and his people directed towards the local blacks that well could have come from the local KKK.

I departed both disillusioned and disgusted, sadly I wondered how a Black had a chance for equality when their "leaders" cared more about money than them.

He serves the black community far better in death than he ever did in life.

I just got into this 2 days ago and the freqs I have are probably old ones too.
If you could share any up-to-date lists for the Summit County/Akron are, It
would be greatly appreciated. Anyways, here's what I got.

423.625Boston Heights PD (dispatched by Macedonia)
424.250Boston Heights PD ch.6
423.950Boston Heights FD (dispatched by Macedonia)

Those were from ScanOhio. Here are some other ones from another website.

39.740 BOSTON HEIGHTS
153.755 BOSTON HEIGHTS

Good luck...

If the 6ths digit is not 5 or 0, then the 7th is a 5. Scanners are
designed to take that into consideration. Have you seen any 7th digit
that is not either a 0 or a 5?

If you recall, Tesla (not the band) invented a means of transmitting power through the ether. The very reason he was not successful was not because it didn't work, but the tycoons were furious about the "giving away" of power.

I believe their RFP includes a 10,000 foot tower in a corn field smack in the geographic center of the state where power could be modulated and radiated. In this manner the equipment would be energized.

I found a few deals at estate auctions as well. The real problem if finding out if it really works or not. I got a Zenith "trans-oceanic" short-wave radio for $5. All it needed was a new battery connection.
I hadn't thought about the local PS. I think I need to check the phone book.....

I recently scored 4 sp50 walkies and a gtx 800 mobile for $250.00.
they wanted $400.00 for the "matched set" but the gtx wouldnt power up due to
the ignition sense wire not connected. pulled the " it doesnt work, i dont want
that one " line, they dropped the price and I left happy.

Telsa didn't understand that power dissipates quickly once it leaves the
antenna. It dies off quickly as the square of the distance. It's what
killed him off. If he had "gotten it", he would have been a lot richer.
His vision gave us AC power and the means of efficiently transporting it.
You can't transfer large amounts of power without wires. Too much loss.

Check the Bearcat repair FAQ at
ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner/Repair_Tips_for_Bearcat_Scanner_Radios

On the BC220 (similar vintage) that I worked on, there was a TIP29
on one corner of the microprocessor/display circuit board that was
used to regulate the main +16v supply down to +9v. The resistor
that fed it was a little crispy, and failure of this transistor
has caused trouble in other older Bearcats.

Good luck!

Matt Roberds

The only real problem I have seen is that there seems
to be a big difference in audio between AM and FM modes.

When I turn the volume up for the aircraft freqs., FM signals
are way too loud. Not really a problem because I plan on
dedicating the 780 to strictly trunked systems. Just
wondering if anyone else noticed this.

Yes, he was murdered, and most likely by powerful forces within the establishment. Here the King family and I agree.

> Just the same, the shot that killed him did
> not have the desired effect - instead of quelling the outrage and cries
> for freedom, they made MLK a martyr and galvanized the whole movement
[...]

The movement described was more against freedom than for it; see

http://www.revilo-oliver.com/Kevin-Strom-personal/Beast_as_Saint.html

and making King a martyr may have been one of the motivations for the killing.

With all good wishes,

But that would not be true - the nation does not commemorate MLK. The nation commemorates a false, glorified, media-created, image of MLK (and a media-created, negative, image of whites).

In reality, Monday is just another day to trash whites with hate-filled, politically correct, rhetoric (a prelude to the white trashing orgy of February's Black History Month).

1055. f.s. scanner antenna coupler - use your existing car antenna 20.00US shipped

Newsgroup: rec.radio.scanner
Date: 2001-01-13 04:52:05 UTC
From: JP <Jpotoma@home.com>
Message-ID: <V9R76.280848$_5.62776577@news4.rdc1.on.home.com>
Source record: 72255

for sale:

one car antenna coupler.

you unplug your existing car antenna from the back of your
am/fm radio, plug it in to this and plug this into your am/fm
radio and plug the second cord into your scanner.

use the same car antenna for both your existing car radio
and scanner.

works very well on VHF-LO
works very well on VHF-HI
works well on UHF
and not too bad on 800mhz, not quite as sensitive as the others.

I will pay for the shipping via US postal service
thanks
brontebear1@home.com

If you are going to the inauguration, take a scanner with you. Strong Signals http://www.strongsignals.net> had the Capital Hill Monitor newsletter on their web page. How about 23 pages of frequencies by any and all agencies in the DC area. If the protesters are as much fun as they were in Seattle at the WTO then having a scanner might be more fun than the actual events.

Capital Hill Monitor:
http://henney.com/chm/1200/

I expect the protesters (left wing extremists) to get violent. There may even be a violent reaction by supporters of GWB.

From the ARRLWeb Letter, Jan. 12th, 2001

* Monitoring for Texas prison escapees: We recently reported that Amateur Radio operators were being asked to monitor 2-meter, Family Radio Service, and Business Radio Service frequencies for possible communications among the seven Texas prison escapees. These fugitives are believed to have shot and killed Irving, Texas, police officer Aubrey Hawkins, KC5USI, during a robbery on Christmas Eve. They also are alleged to have stolen several portable transceivers. An official of the Texas Department of Criminal Justice has requested that hams not publicize their monitoring activities to the general media, in order to avoid alerting the fugitives that their radio communications may be overheard. Amateurs contacted by the media should refer inquiries to the Texas DCJ. Monitors should report any suspicious radio communications immediately to their local authorities or to the Texas DCJ command center, 936-437-6735.

Scored my BC590XLT with a CTCSS board at garage sale. $5 Canadian -- about $3 in US dollars. The scanner works great and so does the tone board. A little light in the 800 to 900Mhz reception department, but that's OK all the services in my town are in the 130 to 512Mhz area anyways.

Did I mention that I only paid 5 bucks for this thing? Damn I love a deal. Picked up a Realistic SX-190 shortwave the same way for $50.00 but I knew that one worked. Love that too. I like the Garage sales first, then flea markets, then the Pawn shops.

Garage sales are usually your best deals, then flea markets -- but they are always more expensive. Pawn shops around here are the worst, too few and too high priced most of the time.

Cell frequencies are illegal to scan and besides, anymore most of the cell traffic is digital and you can't do anything with that anyhow. And furthermore, isn't there quite enough traffic to listen to on the public service bands without trying to listen in on private conversations that are quite boring? I have a Pro 34 that can get the cell bands and even in my earlier days when I did listen once in a while there wasn't anything of interest anyhow..

> scanner made?

This was the first scanner I ever had! Desktop, woodgrain, 20 channels,
30-54, 138-174, 380-512. Mine is date-coded 4A8 which implies April
'88, which sounds about right. Wow, that was a while back. I think
it's a GRE as it was made in Japan.

It isn't natively set up to run on 12 volts, just 120v AC. I looked
into running it on 12 volts once and if I remember right the main
internal supply was about +15v or so. I ran it on +12v on the
bench and it worked OK, but I have no idea how reliable this would
be over the long term.

Actually, I think he was using a computer at home. The message was sent from the "cts.com" server, not from a military ".mil" server. He only filled in the organization block of his email program with "COMNAVSURFPAC," which I doubt would interest the commander.

: Wow...I hope it doesn't get too messy as we expect EMS will be busy most
of
: the day helping George W. Bush supporters (right wing extremists) pull
their
: heads from their asses.
:
Actually we expect a huge amount of violence from the left
wing, to include terrorism. The real question is whether those
on the right will finally stand up to the left and have counter
demonstrations.

But expect the left to try to kill republicans, especially the president.

It doesn't bother me being the way I am. I don't care if I make anyone mad as others can get away if they don't like me. On the other hand, I can't get away from myself and might as well accept myself for the way I am and someday if I want to be as broadminded as you, I reserve that option. Until then, get off my back monkey.

I think it is a real possibility. Security was lax around President Reagan during the early part of his term in office partly because of the leftover Secret Service agents from the pre-Reagan years. Following the shooting incident, in spite of some heroic efforts to protect the president during the shooting, agents were grilled about their political views and if they felt they were fully able to protect the president in spite of those views. However, its been some time since all that occured, and one has to wonder if the Secret Service, a good number entering service during the Clinton years, will be as aggressive when it comes to defending Bush.

Message-ID: <902865D59snorklemediaonenet@63.209.170.215>
Source record: 72279

Well I received the scanner without a hitch.....

The only problem is they sent me the wrong one. I was looking at the ICOM and they sent the Yaesu VR-500 instead. They charged me $350 instead of the $220 I was looking to spend. They are looking into the matter I guess.

Funny thing is that I can get a VR-500 for about $300 stateside. This one is full coverage from 100k to 1.3 gig and quite nice. Thought I might keep this one. Is that a good price for a full coverage scanner or are they cheaper? I did not do my homework on the Yaesu since I was not looking to purchase one.

>Good point on the price thing.

Correct me if I'm wrong here, but hasn't nearly all of the extreme violence of the past two decades come from the right rather than the left?

Two rules apply here ....

A. When the right does it, it is anarchy and violence by hate mongers

B. When the left does it, it is civil disobedience for a just cause.

Good work!
On a somewhat similar vein, I got a Bearcat BC300 (vintage 1980) for
$5 from a flea mart, (I am also a junkie, albeit a flea-mart kunkie!)
but it seems to only lock into signals intermitternly, and when it
does, the displays instantly goes out. Anyone has a similar problem?
Pete

Over half the voters now accept GWB as president. Many wished that they had voted for GWB over Gore, having seen Gore in action during the recount.

We will slowly crush you, like Rome did Cathage.

No wonder you "x-no-archive: yes" everything.

You ought to learn what you are talking about before spewing such tripe.

Hint- rec.radio.scanner is not just for ignorant Americans like you.

Now run off and change your screen name to avoid the kill filters. You do do
that right.

This crap again?????

As I said when this was posted before, I wish the author would seek professional help and get a different job. He is a sick SOB to wish what he does on the general public.

The purpose of the fire, police and medic is to deal with all the things this guy wishes the public could see and to comfort those that have to deal with it. A trained professional would never make the wishes this burned out freak does. I suspect he is not a fireman or medic.

It shouldn't require too much political sophistication to understand
that people tend to be sympathetic towards actions taken by those
whose viewpoints they agree with.

Nevetheless, most of the lethal violence--Oklahoma City, gyno-clinic
bombings, assassinations, Ruby Ridge--have been perpetrated by the
right, not the left.

ATF, US Marshalls (Bush Administration) vs. Randy Weaver & family?

No leftists in that situation.

>Which assassinations are you talking about?

By assassinations, I referred to Dr Bart Slepian, and the other Ob/Gyn
who was murdered along with his bodyguard by right-to-lifers. The Alan
Berg killing took place around '79/'80 as I recall, so that's more
than two decades.

People on the right are more likely to serve in the military out of a sense of duty than the left is. So it would follow that the right is better armed and trained and more capable of wreaking havoc than the left is. Kazenski(sp?) did a pretty fair job of killing and injuring, and as an example of left wing tolerance, he nullified the lefts claim to be more peaceful.

I am perplexed as to why you would consider Ruby Ridge as an example of right wing violence. Seems to me that the violence in this case was started by a government that felt that the right of Randy to feel secure in his home didn't apply to his curtilages ... if the gilley suited Marshall's hadn't shot the dog and triggered the firefight ON THE WEAVERS PROPERTY, Vicky, Randy's son and Degan would all be alive today. If the government had an issue with Weaver, there was a county Sheriff who was quite capable of delivering the warrant. The ATF and USMarshalls clearly overstepped their mandate in this case

And the same for Ruby Ridge. The Waco Sheriff was the proper person to have delivered any warrants the Feds may have had. Had they followed that grand old American tradition of an elected peace officer being the contact between the government and its citizens, "the children" would be alive, Koresh would have been tried, convicted and imprisoned, and the ATF wouldn't become the most despised branch of the ever expanding FedGovCo's army.

I fear the left and it's attempt to educate (read indoctrinate) people far more than I do the right and its firepower. Yeah, the right is dangerous, but not because of its guns or patriotism. It is dangerous because it stands on the ramparts against the left's groupthink dogma.

Message to the left: Do all the social engineering you want with the sheep under your pervue, but touch me, my church, my friends or my family, and you die. We don't need your steeenkeeen feelossofy!!

>Hey....but he gets over 3200 hits a day!

That's a good read. If it's true that Rich gets free scanners, more power to
him.
We should all be that lucky. It's really an easy choice if you think about it
(assuming if it is true). Free radios compared to giving a few ranters the
privlage to speak their mind. That's a no brainer. I assume that you were
banned?

1112. DC Frequency and Link Site

Newsgroup: rec.radio.scanner
Date: 2001-01-13 20:01:30 UTC
From: headshope@aol.comm.htspm

PBScanner has done it again.

Current as of today: 13 JAN 2001

Washington, DC. Frequency and Link List.

Visit: http://expage.com/pbscannerdc

Special page established for the Inauguration of Bush.

Sure to be an active event as related to radio communications.

AS FOR US IN DC:

An agent of two of PBScanner will be there to catch some action,
we will establish a covert post to monitor selected frequencies; someplace in
DC.

Setup:

04 Scanners
- 2: Wideband / 2: 30-899 MHz

04 Antennas
- 01: Discone / 01: 800 MHz tuned
- 01: Directional / 01: Mag Mount Mobile

03 Tape Recorders
w/vox

01: IBM Thinkpad

02: MURS Radios
for comunications/coordination

03: FRS Radios
02 for communications
01 for monitoring

Projected monitring of:
USSS, Park Police, GSA, Public Works, DC PD, DC Fire/EMS, Park Service,
Private Security, GW Hospital, US Army/Air Force, Metro Press, Wash. Post,
Hotel Staff, and some others.

Fixed post and mobile operations.

Both official and unofficial traffic should fill the airwaves, protesters and
protection forces.

(Please no direct emails to this address, all email will be forwarded to tosemail1@aol.com and or spam@aol.com. - I will read all replies here, thanks.)
Site: http://expage.com/pbscanner

Hello,

Well it is not actually dead. it scans but does not stop on anything. not even when the squelch is turned all the way down. Does anyone know what I might look for, other than a new scanner?

Appreciate any help,

Douglas

You're so right, the CTCSS decoder on the PRO2004,5&6 works so much better than the BC9000XLT. PRO2004,5&6 alphanumeric display is so much better. The PRO2004,5&6 tuning knob with Freq/Ch selector is much superior. The PRO2004,5&6 turbo search of 300 steps per second is much better too. The PRO2004,5&6 500 channels are also superior. The PRO2004,5&6 lockout of searched frequencies is just wonderful too.

In case it wasn't obvious, these features are totally absent on the PRO2004,5&6.

I concede the ten search banks are superior - but this advantage is tempered by the much faster search speed of the 9000 and the ability to lock out bogus frequencies from the search function. And you must admit the rest of your points are subjective.

OK,

Lets all disobey the traffic laws and see what happens.
I need to get to work on time, so the laws are unjust to me.

Why do you need to listen to cell phones, anyway?

If you had a life, you would be calling your girlfriend on your cell
phone and having an interesting conversation that losers around your
city would listen to.

With LM mounts you preclude yourself from using any antenna that
required both electrical connections from the coax. Your antenna options
are also much more limited.

LM mounts are made by a company called Larsen. My argument still stands
that your options are more limited with them. Larsen make a fine antenna
and I have used several in the past. I haven't had the kind of luck that
Blake has had with them when compared to NMO and with LM you must buy
Larsen. I will swear on a stack of Gideon bibles that I've never had an
NMO mount leak water, corrode or suffer from the dreaded VHF 5/8
busted-coil.

True ... I was taking a little liberty here. The charge of child abuse was not a Federal statute, nor was any real hearing done to prove or disprove the allegation. Also, the supposed converted rifles were never examined by an outside investigator, so we don't know the truth there either.

The point that I was trying to make, was that the proper mechanism would have been for the Sheriff to knock on the front door, and serve any warrants that were issued if there was a charge by either the Federal or State courts. There was no reason for the ATF to conduct the raid, Koresh's problems were with the State of Texas and the County.

The excessive penalties levied on the survivors by the courts is another sore spot with me.

I wasn't aware the size of something was subjective? The 9000 is a hell
of alot bulkier. Also your 9000 also has more intermod than the 2006
without question. Go to Strongsignals.net and see what most users prefer
by alot? I am not the only one. The audio in the 9000 is not as crisp.
You can do more mods with a 2006 I like the 9000xlt so i am not going to
do a pissing contest. Actually I would take the 895 over the 9000
anyday.

There are violent extremists on both sides, certainly. But at present
we Unibomber (even agreeing that he was leftist, and not an example of
far right anarchy): 2 [deaths]; Oklahoma City (plus deaths from
various abortion clinic bombings: 170+.

The left isn't necessarily more peaceful; it just hasn't wracked up
the same body count as the right. And I thought it worthwhile to
remind Greg of that, because he tends, as some conservatives do, to
see left-wing malfeasance with a clarity that doesn't cross over to
rightist mischief.

See my reply to Doug for RR.

>I fear the left and it's attempt to educate (read indoctrinate) people far

Get in good with the PS owners as 90% of the good stuff never hits the display case and is sold out the back door or in the newspaper. Let him know what you're into when you drop in. When you find something that really is a good deal it will be for one of two reasons. The first, as you've discovered, is the unit it broken. The second, they shop owner doesn't know what the product is.

No .. you have dogma, I have doctrine. :)

As far as the Unibomber being left or right, the old terms are meaningless today ... Ted was associated with left wing causes, ergo et sum, he was from the radical left. The traditional terms are not relevant anymore and I would prefer to use the more relevant terms anti-federalist = left and federalist = right, but most people don't understand those terms, so liberal/conservative, left/right, extreme left/extreme right - religious right and the other terms will have to do.

I am personally a strict constructionist and feel that the Anti-Federalists have had too long of a run and if we don't get back to that system that recognizes human greed, we are all gonna die.

And I prefer to go out shootin'.

Pro-2004s are well known for having bad solder joints. If you are good with a soldering iron then you can probably fix it. If you are not then sell it on Ebay and buy something else. It is probably not worth paying a shop to repair it for you.

> I do know what i am talking about.

No you don't. you made the statement cell capable scanners are illegal. You know, the part you edited out in shame.

> > Hint- rec.radio.scanner is not just for ignorant Americans like you.
>
> Hint- alt.idiots, alt.stupid, and alt.ignorant.fucks are for the dumb,
> ignorant, stupid Americans like you.

What does your childish obscene tantrum have to do with you telling the world cell capable scanners are illegal? They aren't illegal in most parts of the world and this is a international group. What part of that is causing you to lose emotional control? The ignorant part? Sorry, I really meant self-centered ugly American.

> > Now run off and change your screen name to avoid the kill filters. You
do
> do
> > that right.

So explaining to you that cell capable scanners are not illegal everywhere in the world is not having a life? I can see trying to communicate with someone like you must be pretty funny to most. Sort of like talking to a bad smell, but there is entertainment value in the little show you put on. I see many users tossing you peanuts and you just scurry around beating your chest impressing none but entertaining countless.

Unless something new has developed recently then the answer is no.
The last I heard we weren't even able to measure the most powerful
strikes because they destroy the measuring equipment. If we can't
measure it, I'd say it's a pretty safe bet we can't generate it.

The problem is that most left wingers see themselves as the only ones who are rightous. They are very arrogantly self rightous, to the point that any means are justified by their goals. The only thing that saves us is that most left wingers will not dirty their hands by taking up arms. In the '60s left wingers did do a great deal of violence. BTW, OK City may have had a huge amount of dead but it is only one act. And, while I disagree with the thought process, it was done in revenge for Waco. How many on the left did terrorism in revenge for some act? Look at all the Red Brigades in Europe. Or the Weathermen here in the US.

A dangerous assumption. If anything, it is uniting
the right as much as the left. With everyone not
expecting much from GWB, he only has to do a
little bit to be wildy successful.

: Go W.
:
: PS - I'm a Libertarian.

I expect that much of the Gore support
was from people like you. Clinton did
a great job of demonizing the republicans.
In two years I will think that you will find
that the republicans did not do half the
things that Clinton and Gore said they
would (fear tactics). Watch for a number
of folks with your views to drift back to the
republican camp.

The obvious answer would be: yes. Nuclear detonations piss all over
solar bodies (ie: stars), so I think it's a fairly safe bet that they
also make lightning look pretty wimpy.

Of course, I don't think that anyone's going to be harnessing the power
of either for quite a few decades to come.

No. Stars are mechanisms that release energy by atomic fusion. A
nuclear detonation is a fission event.

A nuclear detonation cannot even approach the energy released by a
star, either instantaneously or continually.

Not too long before the ATF attack, several ATF agents went shooting with Koresh. If he was such a dangerous kook, why didn't they arrest him then? Why would they even go shooting with him? Is this standard ATF procedure? There needs to be a trial of the ATF and FBI agents the same as there was of the police officers who shot Diallo. It is usually standard procedure in similar cases, except for the federales since Reno took over at the DOJ. Why is that?

Nah.. that's just the wimpy uranium/plutonium portion. Add in the proper
deuterium/tritium/lithium combo and you get a nifty fusion reaction.

This is a real good scanner that is in new condidtion. I just bought a newer model and don't need two. Comes with the original box, power adapter, antenna and manual. Plus a cable to connect it to the serial port of a computer that I had made at a cable store. $125 shipped COD, or $120 if you send a money order before I ship it.

Email tljb7@home.com if interested.

I know there are examples of left-wing violence from the past two
decades, but it's the right that has racked up the highest body
counts.

If you want to roll some numbers and examples on by, that would be
fine, however.

I suppose you think this one is crap too? It's been going around for at least two Christmas seasons that I know of... Being a Marine myself I can relate to this little "story". And who knows Glenn, maybe, just maybe the next Marine that doesn't get his feelings out in ways like this may just be the Marine you run into someplace and he beats the hell out of you just for the heck of it. You know, his way to vent on the people who think his service means nothing to the people in a country HE protects with his honor and life.

TWAS THE NIGHT BEFORE CHRISTMAS,
HE LIVED ALL ALONE,
IN A ONE BEDROOM HOUSE MADE OF
PLASTER AND STONE.
I HAD COME DOWN THE CHIMNEY
WITH PRESENTS TO GIVE,
AND TO SEE JUST WHO
IN THIS HOME DID LIVE.
LOOKED ALL ABOUT,
A STRANGE SIGHT I DID SEE,
NO TINSEL, NO PRESENTS,
NOT EVEN A TREE.
NO STOCKING BY MANTLE,
JUST BOOTS FILLED WITH SAND,
ON THE WALL HUNG PICTURES
OF FAR DISTANT LANDS.
WITH MEDALS AND BADGES,
AWARDS OF ALL KINDS,
A SOBER THOUGHT
CAME THROUGH MY MIND.
FOR THIS HOUSE WAS DIFFERENT,
IT WAS DARK AND DREARY,
I FOUND THE HOME OF A SOLDIER,
ONCE I COULD SEE CLEARLY.
THE SOLDIER LAY SLEEPING,
SILENT, ALONE,
CURLED UP ON THE FLOOR
IN THIS ONE BEDROOM HOME.
THE FACE WAS SO GENTLE,
THE ROOM IN SUCH DISORDER,
NOT HOW I PICTURED
A UNITED STATES SOLDIER.
WAS THIS THE HERO
OF WHOM I'D JUST READ?
CURLED UP ON A PONCHO,

THE FLOOR FOR A BED?
I REALIZED THE FAMILIES
THAT I SAW THIS NIGHT,
OWED THEIR LIVES TO THESE SOLDIERS
WHO WERE WILLING TO FIGHT.
SOON ROUND THE WORLD,
THE CHILDREN WOULD PLAY,
AND GROWNUPS WOULD CELEBRATE
A BRIGHT CHRISTMAS DAY.
THEY ALL ENJOYED FREEDOM
EACH MONTH OF THE YEAR,
BECAUSE OF THE SOLDIERS,
LIKE THE ONE LYING HERE.
I COULDN'T HELP WONDER
HOW MANY LAY ALONE,
ON A COLD CHRISTMAS EVE
IN A LAND FAR FROM HOME.
THE VERY THOUGHT
BROUGHT A TEAR TO MY EYE,
I DROPPED TO MY KNEES
AND STARTED TO CRY.
THE SOLDIER AWAKENED
AND I HEARD A ROUGH VOICE,
"SANTA DON'T CRY,
THIS LIFE IS MY CHOICE;
I FIGHT FOR FREEDOM,
I DON'T ASK FOR MORE,
MY LIFE IS MY GOD,
MY COUNTRY, MY CORPS."
THE SOLDIER ROLLED OVER
AND DRIFTED TO SLEEP,
I COULDN'T CONTROL IT,
I CONTINUED TO WEEP.
I KEPT WATCH FOR HOURS,
SO SILENT AND STILL
AND WE BOTH SHIVERED
FROM THE COLD NIGHT'S CHILL.
I DIDN'T WANT TO LEAVE
ON THAT COLD, DARK, NIGHT,
THIS GUARDIAN OF HONOR
SO WILLING TO FIGHT.
THEN THE SOLDIER ROLLED OVER,
WITH A VOICE SOFT AND PURE,
WHISPERED, "CARRY ON SANTA,
IT'S CHRISTMAS DAY, ALL IS SECURE."
ONE LOOK AT MY WATCH,
AND I KNEW HE WAS RIGHT.
"MERRY CHRISTMAS MY FRIEND,
AND TO ALL A GOOD NIGHT."
This poem was written by a Marine

stationed in Okinawa Japan.

Scanner is in excellent condition. Original antenna but no manual. Item
is easy to operate. Price is $75 which includes Priority
Mail. The 2037 scanner is a 200 channel base scanner that has the
800-900 mhz. It is excellent at sensitivity and hardly any squelch tail.
thanks Bruce

And do you think Republicans are just going to be sitting on their hands during the 2002 elections? They are just as fired up as the Democrats, so don't be too surprised if your "landslide" doesn't happen.

Andy, what about the LA riots (and other riots around the country)? And what about the deaths of whites each day at the hands of blacks (numbers far greater than the deaths of blacks by whites)? As for Ruby Ridge, that was a minor weapons violation (sawed-off shotgun) that escalated into a firefight after police officers killed a minor child in his backyard (hardly a threat to anyone).

Never had the dreaded mashed down center conductor?

We just do not use antennas that require an actual electrical
connection for the ground, and other companies such as
antennex make LM style antennas also.

I have noticed that it does seem to be one of those polarizing
things, some people swear by NMO mounts, some swear at them. Is
anyone "right"? Nah. Personal preference.

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1206595335

The price is only $23.50 as of this message! Get it while it's HOT!

is auction is for a Regency Monitoradio/Scanner, model ACT-R 10 H/L/U. Physical condition is a 9 out of a 10. This is a crystal controlled scanner with 10 channels. It has red lights that flash from left to right to indicate which channel is being scanned. There are two included antennas that screw into the top of the scanner and there are two jacks for antennas - one for VHF and one for UHF. The installed crystals work - they are frequencies used in my area. I can't guarentee how many of the others work with this scanner. Currently installed in the radio are the following crystals: 154.280, 155.100, 155.070, 155.610, 146.940, 146.580, 154.890, 460.425. Also included are: 155.790, 460.320, 158.250, 146.850, 146.250, 453.525, 156.090, 147.300, 146.550, 158.895, 146.070, 147.190, 153.995, 155.835, 154.995, 159.030, 453.925, 158.970, 122.700, 154.010.

Bullshit.

The government wanting to make an example was the primary cause. If they have no respect for a mans property, they should have had the common sense to know that the dogs would be a problem and if they opened up on that property, Weaver would probably shoot back. You open up on my dog and I am going to be returning fire, and I think that most of the people who live in my community feel the same way.

As it turned out, the courts agreed that the Marshall's pulled a dumb stunt. And that asinine stunt is what predicated the shooting. Had the Marshall's come up the road, wearing their uniforms and badges, driving a marked car, Vicky would not have been assassinated, the son and dogs would still be alive and a family would not have been destroyed.

Weaver was under no obligation to presume that the gilly clad Marshall's were anything other than thugs who were intent on killing him. I think that Lon Horiuchi committed murder and should still be in prison. The 3.1 Million dollar settlement the government paid the family is proof in my eyes that the government was wrong and to have the citizens pay that damage award to protect Government butts is a double insult.

As far as Waco ... I guess that you believe that oopsies count. They didn't have a no-knock warrant, so they did a no knock raid and called it a "dynamic entry". They lied on the warrant about what they wanted to seize. They lied to the military to get military equipment and commando training. They lied to Koresh. They lied to congress. Yet the bastards walked. Not one Fed was prosecuted for perjury. And innocents died because of that swaggering arrogance of theirs.

You can cite all the legal technicalities that you want ... the government was clearly wrong in both instances and deserves no mercy. And no citizen should ever be required to obey an illegal order.

You don't see a difference between the two?

Why would a fireman wish that everyone could suffer the pain and agony he sees everyday in his job? What kind of sick SOB would wish this on anyone? A fireman's or a medic's job is to see the horror and pain and try and relieve that of those civilians around them. If he can't live with it he should get another job. The author was obviously not a fireman or a fireman having a mental breakdown.

So again, tell how a solders suffering and a fireman doing his job are the same?

Maybe you ought to open your eyes and think for a moment before spewing your threats and ignorance.

I hold fireman/medics in the highest regard. No questions asked. They do an important and wonderful service. Where did I say differently "The Realms"?????

What you didn't write, the Xmas Story was nice, what you wrote to me was crap.

BTW, the fact you are a marine doesn't impress me Macho Man! I went to school with a number of criminals that were given a choice of the marines or jail. I also know a number of draftees that were forced into the Marines. Wasn't Charles in the Texas Tower a Marine? Lee Harvey Oswald was a Marine. Being a Marine doesn't make you a man, it just makes you think tough is all there is. You prove that below. You can't think straight and your only response is threats of violence.

Again, try and actually understand what I say rather than what first pops into your thick head.

Glenn

I don't think he is a sick sonofabitch. I also don't think that he actually wants us to see it either.
Although if you do think he is sick you are getting what he means you to get.

it's POETRY guys, just because it doesn't rhyme! The whole idea of the piece is to generate human emotion, obviously he has succeeded. He wants to revolt you with his words, because he DOESN'T want you to see what he does.

Except, of course, cop-killing, which should concern most readers
of this group.

I don't know Dwight, I would agree if the author had a reason to want to sound revolting but it strikes me as a poor me pity type of blather.

What do you think his point is? He says it all in the end ;

"Unless you have lived with this kind of life, you will never truly understand or appreciate who I am, we are, or what our job really means to us...

I wish you could though."

We can't understand or appreciate what a fireman does because we don't see all he does?

Guess that goes for every profession in the world doesn't it?

Nurse, Doctor, Policeman, Dentist, and the Speedy Mart Clerk.

Guess nobody can appreciate nobody or anything until you see it through their eyes.

He doesn't revolt me, he makes me feel sorry for this burned out sorry individual that is in the wrong profession or just been there too long.

If you are doing a job and need to know others understand what you do and appreciate you, well you are in the wrong job or doing it for the wrong reason.

Glenn

You're roving pretty far afield there, buddy. Th Red Brigades do
not operate in this country, and members of the Weathermen and
similar groups are now either dead, in prison, or no longer politically
active, so you're flogging a dead horse there. Remember, if you
go blaming currently active liberals for those acts from past radicals,
you open the door to all sorts of things, like legitimizing blacks
blaming currently living whites for the actions of white slaveowners
150 years ago. Don't want to go there, now do you?

You know, for some odd reason I mostly agree with you here, except for
the fact that, when the illegal orders are given to whites sheltering themselves

under "religion" or "conservative values", there's all this sympathy for them,
but when it's blacks or poor people (as in Philadelphia's immolation of the
MOVE headquarters) then they're evil monsters that deserve to be shot
down like dogs. As far as I'm concerned, David Koresh was a cop killer, and

so is Mumia Abu-Jamal. If you're for exonerating one, you've got to be for exonerating both in my book. Otherwise you're just reserving the right to pick and choose which cops get killed -- and that makes you a cop-killer supporter.

1187. Listening to Airlines

Newsgroup: rec.radio.scanner
Date: 2001-01-14 07:57:11 UTC
From: RDK <rdk1@atdial.net>

What is the best way to listen to airline company's VHF/UHF frequencies while their in flight? I would like to be able to monitor company freqs as well as other inflight conversations pilots have while enroute. Being from the bay area (northern california) what do I need and where may i obtain the necessary freqs. Thanks in advance

1188. Common frequencies and tones for Department Stores

Newsgroup: rec.radio.scanner

Hi All,

The following is a list of common frequencies and tones which can be found at various Shopping Malls across the country. It was compiled from frequency reports on both coasts of the county and also Hawaii.

This list can be very handy in identifying the various businesses at Shopping Malls across the country. Some of these businesses such as Hechts (east coast) and Mervyns (west coast) are regional to certain parts of the country.

Please note that several businesses such as Express, Structure and Limited all use the Motorola Spirit GT Two-Way Radios. These look just like FRS radios and even have the same call button feature the the Motorola FRS radio have.

http://commerce.motorola.com/cgi-bin/ncommerce3/CategoryDisplay?cgrfnbr=210598&cgmenbr=126

I would be very intested in hearing from anyone that has seen different frequency and tone combinations which are not on this list. Especially the ones from Williams-Sonoma which does not appear to use any common frequencies or tones.

Regards,
Bob

Banana Republic
Common frequency and tone 151.8350 PL 74.4
Confirmed frequencies and tones:
151.8350 PL 74.4 Operations

First off, I don't consider the Feds "police" and if a Fed gets killed, it isn't a cop getting killed. A cop in my book exists only at the State level on down. Having said that, I don't condone killing Feds either.

I am not for exonerating Koresh. Had the Feds bowed out and left the investigation to the locals, Koresh's activities would have been investigated, and if he was doing anything illegal, he would have been tried an convicted. As it stands, we have only the un cross examined testimony of Kerry Jewel as to his sexual abuse of a minor. Which, may I add, as abhorrent as the crime is, it is not a Federal matter.

I have little knowledge of the MOVE issue, so you have me at a disadvantage, but it seems to me the one major difference in the two events was that MOVE didn't have a rogue Federal agency lying about the circumstances to make sure they got the warrant they wanted. It was the local Phillly police and mayor who bungled the MOVE fiasco. And I understand that police were refused entry into the building to serve the warrant to Mumia Abu-Jamal, and that is when MOVE began barricading the compound.

And the only time that I would support killing a cop is when that cop is acting illegally. As much as I believe that the Feds had no rightful interest in Mt. Carmel, had the ATF had simply drove up to the front door of the compound with the *legal* warrant in had, knocked on the door and had been met by a hail of bullets, I would have been hard pressed to defend Koresh. But as it was, I saw a bunch of ninja clad warrior wannabes performing a thinly disguised, no knock entry on a peaceful church commune. And the curiously missing front door only adds fuel to my belief that it is likely the Feds fired first. I think that had the bullet holes been coming out of the door, that door would have been found and been enshrined in an acrylic vault for the world to see.

These are some of the frequencies that you should monitor:

The common Airline Company Ramp frequencies:

460.6500 460.7750
460.6750 460.8000
460.7000 460.8250
460.7250 460.8500
460.7500 460.8750

The common Airline Company Enroute frequencies:

122.8250 thru 131.9750 with at 25 khz step

The ATC frequencies for OAK, SJC and SFO which can be found at
the AirNav site at http://www.airnav.com

These are some of the Operations and Ramp frequencies that can be
found at Oakland International (OAK)

Southwest Airlines
461.0125 DPL 074 Ramp
461.2125 DPL 612 Ramp
463.5625 DPL 074 Ramp
464.3625 DPL 074 Ramp
464.6375 DPL 074 Ramp
131.7000 Company Approach frequency

United Airlines Motorola Trunked System (New system being tested)
460.6750
460.7000
460.7750
460.8000
460.8750

These are some of the Operations and Ramp frequencies that can be
found at San Jose International (SJC)

Alaska Airlines
465.8250 PL 114.8

American Airlines
460.6500 PL 127.3 Ramp
464.9125 PL 156.7 Ramp
129.2000 Company Approach frequency

Continental
469.5000 PL 127.3 Ramp

Southwest Airlines
463.7125 DPL 132 Ramp
131.7000 Company Approach frequency

United Airlines
460.7250 PL 186.2 Ramp
129.5000 Company Approach frequency

These are some of the Operations and Ramp frequencies that can be
found at San Francisco International (SFO)

Southwest Airlines
131.7000 Company Approach frequency

United Airlines
460.7250 PL 203.5 Ramp
460.8000 PL 203.5 Ramp
460.8750 PL 203.5 Ramp
461.1375 PL 203.5 Ramp
461.2875 PL 203.5 Ramp
461.3125 PL 203.5 Ramp
461.5625 PL 203.5 Maintenance
461.6375 PL 203.5 Ramp
461.9375 PL 203.5 Ramp
464.3250 PL 203.5 Ramp
464.8125 PL 203.5 Ramp
464.9750 PL 203.5 Security at MOC (United Maint Operations Ctr)
129.5000 Domestic Gate Assignments
Pre-departure comms
Maintenance
131.4000 Airborne Ops (troubleshooting)
131.0000 International gate assignments
Pre-departure comms
131.0000 Load planning
130.2200 Maintenance - domestic
131.0000 Maintenance - International
5.5470 HF Check (low power)

Uses an RF2915 transciever chip, maybe that will help determine frequencies.

See http://www.rfmd.com/DataBooks/db97/2915.pdf for details on this chip.

I believe the Bearcat 250 was introduced in 1977 or 1978. I have a 1978-vintage Bearcat 250 still in use which I bought 5 years ago at a hamfest for $10! I think it's a great scanner,fairly sensitive, and the search and store is a feature that even my PRO-2006 does not have. The only other radios I have with that feature are the Icom R8500, possibly my 890XLT. I own a few other Electra Bearcats, and as a result, I've been buying parts units at swapmeets just to have spare parts in the event a repair is needed.

the law.

and exactly what legal violation was Mr Weaver ever convicted of????

You say he was ignoring the law, so exactly what law was he ignoring?

How exactly does his ignoring the law justify the BATF to also ignoring the
law?

> The Government wanting to make an example of him was the 2nd direct cause.

BINGO. They wanted him to do something, he didn't want to do it, they
attempted to force him, he refused.....then they murdered his family.

I still fail to see any justification for the government's violation of the
law.

> HAD the persons involved just let the Feds search, there wouldn't have
> been the result we saw. But the Branch Davidians WANTED an inferno,
> as Korresh prophesied, and they got it.

Would this be the same Korresh that INVITED the BATF to come out and
peacefully search what they wanted?

Yea, certainly sounds like someone that needs to have an illegal military
style raid.....

1212. Re: Take a scanner with you to the Inauguration

```
: > I expect a Democrat landslide in 2002.
:
:
: And do you think Republicans are just going to be sitting on their
: hands during the 2002 elections? They are just as fired up as the
: Democrats, so don't be too surprised if your "landslide" doesn't happen.

We are in a long term campaign. Think of it as a never
ending election. The campaigning never stops. Liberals
are already using the nominations of GWB as the basis
for the 2002 election cycle and campaign slogans. Remember
the Left needs enemies in order to define themselves. It
was the same tactics that Hitler used, which they have studied
over and over.

We need to defeat them now. Think about it, 30 states voted
in favor of GWB therefore those states' senators have strong
reasons to support GWB's nominations. Email your state's
senators and let them know that you support GWB's choices.
The Left already has it machine working (if anyone finds the
web page where they are coordinating that attack, please post
it).
```

Introduction to Scanning
by Bob Parnass, AJ9S

[NOTES: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner, and
rec.radio.info. It is also available electronically from
the rec.radio.scanner ftp archive on the official USENET
FAQ library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

This introduction is intended for people new to the
scanning hobby and is oriented to scanning in the USA.
High level overviews of the following topics are presented:

Why Scanning?
Is Scanning Legal?
What Scanner Should I Buy?
What is a CTCSS and DCS Tone Squelch Feature?
How Do I Determine the Proper CTCSS or DCS Code?
Scanner Antennas
Coaxial Cable Feedlines
Where Can I Buy A Scanner?
Modifying Your Scanner
Scanner Repair Shops
Where Can I Obtain Frequency Information?
Do Your Own Frequency Detective Work
How Can I Use Equipment to Uncover New Frequencies?
Scanner Clubs and Mailing Lists

Why Scanning?

Every day and night, scanner hobbyists are entertained by
what they overhear on their radios. Police cars, fire
engines, ambulances, airplanes, armored cars, trains,

taxis, and buses are all equipped with radios and you can listen to them. You can monitor the local sheriff and fire departments to hear about events "as they happen," before the news reporters hear about them. Hostage dramas, bank robberies, car crashes, chemical spills, neighbor and domestic disputes, tornado sightings are all fair game. In a single afternoon, you can hear a high speed police chase, Drug Enforcement agents on a sting operation, and undercover FBI agents as they stakeout a suspect.

How about listening to a team of G-men protect the president while transmitting in the 167 MHz range?

Baby monitor intercoms are actually transmitters and you can hear them between 49.67 and 49.99 MHz.

Stay ahead of road conditions by listening to highway road crews, snow plows, and traffic helicopter pilots. Many midwesterners monitor the state police and and county sheriff to learn of approaching tornados long before warnings are broadcast on TV and commercial radio. Take your scanner to sporting events and listen to race car drivers, football coaches, etc., in the 151, 154, and 468 MHz ranges.

Monitor the everyday hustle and bustle of businesses, from cable TV repair crews tracking down pirate descrambler boxes, to security guards at your nuclear power plant or mall security guards chasing a shoplifter.

Is Scanning Legal?

In the United States, scanning from your home or at work is perfectly legal in most situations. The Electronic Communications Privacy Act of 1986 made it illegal to listen to mobile phones, common carrier paging, and a few other types of communication. Public law 103-414, signed Oct. 25, 1994, amended the law (Title 18 USC, Part I, chapter 119, sections 25110 and 2511) and outlaws listening to cordless phones, too, but many scanners cover these frequencies.

It is illegal for companies to sell or import into the USA recently manufactured scanners which cover or can be easily modified to cover the cellular phone frequencies, but sales by private individuals will still be allowed.

The rules define "readily altered by the user" as "clipping the leads of, or installing, a simple component such as a diode, resistor and/or jumper wire; replacing a plug-in semiconductor chip; or programming a semiconductor chip using special access codes or an external device, such as a personal computer."

Speaking of privacy, federal law also requires you to keep what you hear to yourself and not use the information you hear on your scanner for personal gain.

Be aware that several states have laws pertaining to scanning while in your car. Indiana restricts some portable scanners. A few states have enacted their own laws against listening to cordless phones. You can find out about these restrictions in a paperback book, Listeners Lawbook, compiled by Frank Terranella, Esq. available for $9.95 + shipping from Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902.

What Scanner Should I Buy?

Radio Shack and Uniden (maker of Bearcat, Regency, and Cobra brands) offer a wide choice of scanners. Radio Shack scanners are actually manufactured by both GRE (General Research Electronics) and by Uniden. Personally, I don't recommend Trident nor many of the AOR brand scanners, although the AR8000 and AR3000 have good reputations and the AR5000 works well.

Programmable (synthesized) units have replaced crystal controlled models as they don't require crystals and usually have a keypad that permits you to store frequencies into channels. Programmables are now so cheap it doesn't make sense to buy a crystal unit as your main scanner unless you get it for under $45 or so.

You can get a battery operated hand held scanner, a bigger "base" scanner which is powered from an AC outlet, or a mobile scanner which connects to your auto's electrical system. There are tradeoffs -- base and mobile scanners have larger displays and almost always provide more audio than portables, and some portables are more prone to interference when connected to outdoor antennas than base models. But when severe weather knocks out the power in your home, there's nothing like having a battery operated scanner to monitor the power utility and police frequencies!

Make sure your first scanner has a "search" feature, which allows it to search all the frequencies between two frequency limits of your choosing. Beware of low cost programmables which can't search. Some models, like the early Uniden SportCats and Radio Shack PRO-2046, allow searching between limits, but the limits are factory programmed and cannot be altered.

Get a model which covers the 800 MHz band. Usage of the 800 - 950 MHz band is growing fast and you will miss out on the action unless your scanner covers this band.

If you're not sure whether you'll like scanning, don't want to spend much money, a 50 channel scanner will do. In general, the more channels and banks, the better.

Most of the action takes place on frequencies between 30 and 1000 MHz, so don't be misled by scanner models boasting coverage from 3 to 2000 MHz. There's currently not much to monitor in the 1000 - 2000 MHz range.

If you are interested in receiving short wave, that is, signals in the 3 - 30 MHz range, it's best to get a short wave radio specifically designed for that purpose. Although some scanners receive the short wave band, their performance in that range is often second rate. The $1500 Icom R8500 and $2000 AOR AR5000 models are exceptions.

Deluxe scanners can be controlled and/or downloaded by a personal computer, a feature which appeals to a small but growing number of scanner owners.

Almost all low and mid-priced scanners are prone to receiving images -- receiving the same signal erroneously on two or more frequencies. With a few exceptions, images are unwelcome due to the interference they cause, e.g., hearing aircraft transmissions while the scanner is tuned to the local police frequency. Premium quality scanners use "up conversion" circuitry, a scheme which greatly reduces, but does not eliminate, image reception.

Currently, the more popular scanners include the discontinued Radio Shack PRO-2042 and PRO-2006 base/mobiles, the Uniden/Bearcat BC895XLT, BC245XLT, SC200, and Radio Shack PRO-91 and PRO-94 portables. A number of owners report problems with the Icom R1 portable and the older Uniden/Bearcat 8500XLT base and 2500XLT portable. The Uniden BC9000XLT base and BC3000XLT portable work very well and are my current favorites. The ICOM IC-R2 and Yaesu VR-500 are the two smallest "pocket" scanners which perform. Both are tiny enough to fit comfortably in a shirt pocket so you can monitor without attracting undue attention.

Looking for value? At $170 discount price, the 100 channel Uniden/Bearcat BC278CLT base is a good value and available at most Sears and Best Buy stores. The Uniden Sportcat SC200 portable performs very well is an excellent value at its $220 street price.

CTCSS and DCS Tone Squelch Feature

Upscale scanners can be optioned with a subaudible tone decoding squelch circuit. There are two types: CTCSS (Continuous Tone Coded Squelch System) and DCS (Digital Coded Squelch). In simple terms, this feature lets your

scanner ignore signals you don't want to hear.

Most land mobile two way radios, except trunked systems, transmit either CTCSS or DCS signals subaudibly along with the voice information. U.S. military field radios employ wider deviation and a 150 Hz CTCSS tone, not supported by most scanners or CTCSS decoders.

There are over 40 different CTCSS codes and you can program a specific CTCSS or DCS code into each memory channel. Using a CTCSS or DCS decoder permits your scanner to open the squelch only if the transmission has a code which matches the code you program.

CTCSS and DCS decoding offers several advantages:

1. Ignore unwanted signals on shared frequencies: It is common for several users to share the same frequency, e.g., my county sheriff uses the same frequency as Chicago Police, located about 60 miles away. I want to hear my sheriff's transmissions but don't want the scanner to stop on or listen to Chicago Police transmissions. This is especially a problem when radio propagation is good, e.g., during a "band opening," when reception range is temporarily increased.

2. Combat intermodulation interference: Helps keep out intermod and image interference from strong pagers and other signals which are not transmitted with a matching code.

3. Ignore scrambled transmissions: Many federal law enforcement agencies (FBI, Secret Service, etc) and some local police agencies employ digital voice scrambling, which sounds like white noise and is annoying to hear. The CTCSS or DCS code is sent only when the station is transmitting unscrambled, or "in the clear." You can program federal frequencies along with the proper code into your decoder-equipped scanner so you won't have to listen to the scrambled mess and only hear their transmissions when they are unscrambled.

CTCSS also goes by various tradenames: Motorola's PL (Private Line), GE's Channel Guard, and RCA's Quiet Channel. Motorola uses the tradename DPL (Digital Private Line) for its digital coded squelch.

How Do I Determine the Proper CTCSS or DCS Code?

There are a few ways to determine the CTCSS or DCS code transmitted by a station:

1. Use an outboard CTCSS/DCS reader which must be attached to the discriminator output circuitry inside the scanner. The reader has an LCD or LED display which indicates the code when a station transmits. I use a CSI model CD-1 Communications Decoder Unit, an an excellent reader which sells new for about $200. (Connect Systems Inc., Ventura, CA, 800-545-1349, http://www.connectsystems.com).
2. Many of the ScannerMaster guides, as well as scanner club newsletters, print the CTCSS codes used by transmitting stations.
3. On some scanners equipped with the CTCSS squelch, you can program into memory the frequency of interest. Then you "tune" slowly through all the different CTCSS and/or DCS codes until the squelch opens and you hear the dispatcher talking. This is a slow process and the station has to keep transmitting during it.
4. A slow, brute force method is to program the same frequency but a different CTCSS code into several channels and see where your scanner stops.
5. In some cases, I've actually examined the walkie-talkies I want to monitor and found the CTCSS code printed on a label on or inside the radio.

Scanner Antennas

All scanners come with a built in antenna, permitting reception up to about 20 miles or so.

Portable scanners are supplied with a helical (spring shaped) antenna, covered by rubber. The rubberized antennas furnished with current models are too stiff and place stress on the antenna jack. Older scanners to be supplied with more flexible antennas. I prefer these alternative antennas for use with portable scanners:

1. The Icom FA-1433B dual band flex antenna, a thin and very flexible rubber antenna, is slightly longer than a stock heliflex but provides better performance. The Premier (Prime) RD-9 and RD-9SMA are about the same length but even thinner.
2. The Austin Condor is a 12" long rubberized antenna available for about $30. While considerably longer than the stock antenna and the FA-1443B, the Condor is very flexible and provides VHF-high band reception superior to both. It is not designed to cover the VHF-low band, but will allow reception there at least as good as shorter antennas. The Austin Condor is available from Grove Enterprises.
3. The "Thin-Stick" is an 18 inch telescoping antenna for extended range. It is made in USA by Smiley Antenna Co., Inc. and is designed to cover both the 2 meter

and 220 MHz bands, but its variable length means it can be adjusted for optimum performance on other bands. What makes the Thin-Stick different from an ordinary telescoping antenna is the spring between the antenna and the connector portions. The spring absorbs most of the impact if the antenna collides with an object. The street price is about $17 and it is available from Amateur Electronic Supply, Milwaukee and other retailers.

Outdoor antennas, like the Channel Master 5094A (available from Amateur Electronic Supply) or Antenna Specialists AV-801 (recently discontinued), can extend reliable reception to 50 miles or more, depending on terrain. If you do use an outdoor antenna, be sure to disconnect and ground it during storms and when not in use to avoid a lightning hazard. Discone and ground plane type antennas can be more prone to cause scanner damage due to static charge buildup because they are not at "DC ground."

Coaxial Cable Feedlines

If your antenna installation requires more than 50 feet of feedline, use RG213/U or high quality RG8/U coaxial cable. RG213/U, e.g., Belden type 8267, has a non-contaminating jacket and will last longer. Each has an outer diameter of about 13/32". Similarly sized Belden 9913 cable and clones have lower attenuation but are difficult to bend, require special connectors, and can accumulate moisture inside because they are hollow.

If you must use a small diameter cable for long runs, use RG6/U. Avoid RG58/U (7/32" OD) due to its losses at high frequencies. RG8/X (1/4" OD) is suitable for short patch cords.

Where Can I Buy A Scanner?

Almost every community has at least one Radio Shack store, and you can find scanners there. Be sure it is on sale, as Radio Shack list prices are high and their scanners are offered at reduced prices by mail order discounters.

Discount chain stores like Wal-Mart, Best Buy, K-Mart, Service Merchandise, and Circuit City sell scanners, but carry just a few models. Department stores, like Sears Roebuck and Montgomery Wards, sometimes offer low end scanners, although at high prices.

The best buys on new scanners are from reputable mail order radio dealers, for example:

- Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902. For a free catalog, call (828)837-9200. Telephone (orders only): (800)438-8155. Web page is http://www.grove-ent.com

- National Electronics (formerly National Tower Company), PO Box 15417, Shawnee Mission, KS 66215. Telephone (800)762-5049, (913)888-8864. Web page is http://www.sound.net/~ne/

- The Ham Station, 220 N. Fulton Ave., Evansville, IN 47719-0522. Telephone (800)729-4373, (812)422-0231.

- Scanner World (Albany, NY). Telephone (518)436-9606.

- Amateur Electronics Supply (Milwaukee, WI). Telephone (800)558-0411. Web page is http://www.aesham.com

Beware of inflated "shipping and handling" charges and be sure to include these when comparison shopping.

Used scanners may be found at hamfests, flea markets, garage sales, or listed in the classified advertisement section of your newspaper.

Modifying Your Scanner

The term "mod" is often used as shorthand for "modification." If you are handy with a soldering iron, you may be interested in modifying ("modding") your scanner to add features or enhance its performance. Be warned this usually voids your warranty and current models are difficult to service due to the small, delicate surface mount components. Modifying any scanner to receive cellular phone signals is now considered illegal. By federal regulation, new scanner models must be designed to they cannot be easily modified to tune the cellular phone bands.

The term "mod" has been narrowly used by some people to mean a change which permits a scanner to receive cellular phone frequencies. This definition is far too restrictive as there are several ways one could modify a scanner, e.g., changes to improve audio quality, adding an S-meter, expanding the number of channels, changing the earphone jack to accept stereo headphones, etc.

Modification article files can be copied from several ftp sites including the /pub/hamradio/mods directory at:

garfield.catt.ncsu.edu
oak.oakland.edu (IP address 141.210.10.117)

Modification articles posted on Usenet seem to have a life of their own. Frequently, they are plagiarized from the

Internet and compiled by book, CDROM, and magazine publishers, sometimes reworded, then sold. Hobbyists then copy the modifications from the books, CDROMs, and magazines back onto the Internet or BBSs (bulletin board systems)!

Grove Enterprises and other companies advertise a warranted, modification for fee service.

Scanner Repair Shops

Is your scanner broken? Aside from sending the scanner back to the manufacturer for repair, here is one company which repairs scanners:

- G & G Communications (telephone 716-768-8151) - (http://www.iinc.com/ggcomm or email ggcomm@iinc.com or ggcomm@aol.com) This family owned company repairs scanners and pagers and stocks parts for several older models. G & G cannot usually repair AOR scanners due to lack of manufacturer support. G & G sells and sometimes buys old scanners and parts, too. They are located at 7825 Black Street Rd., LeRoy, NY 14482.

Repair tips for Bearcat and Radio Shack scanners are discussed in two other FAQ articles.

Where Can I Obtain Frequency Information?

To avoid chaos, the FCC licenses two-way radio users and assigns them specific frequencies. Groups of frequencies are allocated to specific types of users, so you won't usually find fire departments using the same frequencies as taxi drivers, for example.

Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books: The most convenient source of fire, police, and local government frequencies is Gene Hughes' Police Call Plus, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores. The newest editions contain abbreviated business listings, too, although callsigns and other details are listed only for local government and public safety licensees.

I also recommend the book, Monitor America, published by SMB Publishing (now known as Scanner Master Publishing), and available from Grove Enterprises for about $30. A 1100 page 3rd edition is now available. Monitor America contains several pages of police, fire, local government, news media, sports, federal government, and commercial

broadcast frequencies for all 50 states. It contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Uniden has published several regional directories using the "Betty Bearcat" name, although there are much better directories available from Scanner Master (Newton Highlands, MA, tel. (508)655-6300) for some regions.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Commercial Magazines: Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times (tel. 828-837-9200, http://www.grove-ent.com) and the sensationalistic Popular Communications, (tel. 516-681-2922). National Scanning (NatScan) is a national scanner magazine published bimonthly and is affiliated with Uniden's Bearcat Radio Club. The best scanner frequency lists are often found in club publications, not commercial magazines, and are discussed later.

Government Records: Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS). The high cost of buying government records limits their appeal to hardcore enthusiasts. You can write for a catalog of FCC Master Frequency Database items to the NTIS, 5285 Port Royal Road, Springfield, VA 22161.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the

public on CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM. The PerCon Spectrum CDROM sells for under $29 and contains a handful of fields for every FCC license in the US. The Spring 1995 edition works in DOS, Windows, and Mac environments.

Grove enterprises sells FCC license information on CDROM, too.

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country since 1994, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a beautiful 11" by 17" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc. See http://www.megsinet.com/~parnass for a sample.

RadioMap has been advertised monthly in Monitoring Times magazine since 1995. The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)

dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $10.00, the deluxe report includes an extra index sorted by frequency and a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $39.95 for deluxe RadioMap report with histogram and additional index by frequency. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

Do Your Own Frequency Detective Work

When you try listening to a frequency for the first time, you'll want to know who you're hearing.

Although FCC rules require radio systems to identify their operations with their assigned call letters either automatically or verbally, most ignore the regulation. This often makes it difficult to know who is transmitting. Moreover, many radios are now being placed in service illegally, without first obtaining the required FCC license.

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and try to determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an

invitation.

Most listeners use a combination of both approaches.

You can examine the FCC license on premise. I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the mall security office or company guard shack. You can examine the labels on radio equipment. Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret. Hobbyists are urged to exercise a modicum of restraint and good judgement, however.

How Can I Use Equipment
to Uncover New Frequencies?

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. A few models, like the ICOM R7000/R7100, and R1, and older Bearcat 250 and Regency K500, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy, a Radio Shack CTR-82 will do. It's best to use a shielded, attenuating cable to feed the scanner audio into the recorder rather than relying on the recorder's internal microphone.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at

the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

Are There Any Scanner Clubs or Mailing List?

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than any pile of magazines.

Clay Irving <clay@panix.com> administers a scanner electronic mailing list, called "scanning." To subscribe, send an Email message to: majordomo@lists.panix.com

In the body of the Email message, put: subscribe scanning

Other scanner mailing lists include: scanner@onelist.com, scan-l@onelist.com, scanner@qth.net, and sonofrcma@onelist.com.

All Ohio Scanner Club

A smaller club is the All Ohio Scanner Club. Its bimonthly publication, The American Scannergram, is about 60 pages long. Although concentrating on Ohio and the Northeastern states, there is frequency information from other states, and plenty of good product reviews and scanning tips.

Annual dues are $18.50 and more information is available from:

Dave Marshall, Managing Editor
All Ohio Scanner Club,
50 Villa Road,
Springfield, OH 45503.

Chicago Area Radio Monitoring Association

The Chicago Area Radio Monitoring Association (CARMA) is the foremost club for scanner radio hobbyists in the northern Illinois area. CARMA was formed from the Chicago chapter of the Radio Communications Monitoring Association (RCMA), and we have been meeting since the early 1980s.

Many CARMA members are active in ham radio and GMRS, but the club is devoted to scanning and scanners.

Meetings are held on Saturdays, many at area restaurants, about 6 times a year. Although lunch starts at noon, the meetings begin officially at 1 PM and often run until about

4 PM. You must purchase a lunch since we get the room for

- 2 -

free. Meetings consist of a quick review of club business, sometimes a special presentation, and a "round table" discussion/question & answer session. Large quantities of information and frequency lists are often distributed in the form of free handouts. Members often sell radio equipment at the meetings, too.

In addition to regular meetings, there are two CARMA picnic/field days during which members meet at a park, erect antennas, eat, and operate scanners from battery power. CARMA members take organized tours of various communications facilities in the area.

Club meeting dates and times are published on the CARMA email list, carma@qth.net. You can obtain a free electronic subscription to the CARMA email list. For more info, see:

http://www.qth.net

The club's mailing address is:

CARMA
P.O. Box 2681
Glenview, IL 60025

Most meetings are be held on Saturdays at Phillies Pizza, 6300S. Kingery Highway, located in the shopping center at the corner Rt. 83 and 53rd St. in Willowbrook, IL.

HOW DO YOU FIND THESE SCANNER FREQUENCIES?

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. It is posted twice monthly on the USENET groups rec.radio.scanner, alt.radio.scanner, and rec.radio.info. It is also available electronically from the rec.radio.scanner ftp archive on the official USENET FAQ library ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner. The author writes a monthly "Scanner Equipment" column for Monitoring Times magazine, published by Grove Enterprises, but views expressed in this article are his own.]

I am often asked, "How do you find these frequencies?"
This article answers the question in various sections:

Books
Magazines
Government Records
Web Sites
Federal Radio Stations
Radio Clubs
Do Your Own Sleuthing
What Makes Station Identification Difficult?
Examine the FCC License on Premise
Examine the Labels on Radio Equipment
Examine the Antenna to Determine Frequency Band
Equipment to Determine Frequency Usage
How Can I Determine To Whom I'm Listening? - An Example
Summary
Addresses

Books

The most convenient source of fire and police frequencies is the Police Call Plus, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and

larger book stores for under $13. Police Call Plus is basically a computer printout of FCC license information in the fire, police, local government, and conservation services in two lists: by licensee name within state, and by frequency. A few pages of local airport and nonsensitive federal government frequencies are included. Selected business frequencies are listed, too, but without callsigns and other details.

I highly recommend Richard Barnett's book, Monitor America, published by Scanner Master Corp. A 3rd edition is available from Grove Enterprises for about $30. It is crammed full of police, fire, local government, news media, sports, national park, and commercial broadcast frequencies for all 50 states. The information was compiled mainly from members of the Radio Communications Monitoring Association (RCMA), now defunt. Monitor America contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call Plus, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Scanner Master also publishes regional frequency guides for Illinois, Florida, Virginia, Massachusetts, New Jersey, and other states.

Aeronautical frequencies are covered in the Aeronautical Frequency Directory, written by Bob Coburn, W1JJO. Although most of the information is about civilian aviation, Bob included sections on military mid-air refueling and CAP. The 401 page third edition is available from Official Scanner Guides (P.O. Box 525-NS, Londonderry, NH 03053). The same publisher sells the Maritime Frequency Directory and frequency guides for several New England states. Some of these books are available through Radio Shack, too.

The longstanding source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range. Since the US government no longer offers frequency information for its own stations, and has never published sensitive frequencies, most of the information in Kneitel's book has been collected from listeners over the years. It

is certainly not complete, nor 100% accurate, but is a good book for this difficult to obtain information.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Magazines

Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times and the sensationalistic Popular Communications magazines.

Government Records

Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS).

These lists contain license information for the industrial (e.g. Illinois Armored Car, Pinkerton's Security, Joe's Towing, etc.), highway maintenance, commercial broadcast, aviation, common carrier, and maritime services, as well as for police and fire. For more info call NTIS at 703-487-4630.

Back in "the good old days," Grove Enterprises sold copies of some FCC microfiche files, and this was much cheaper than buying directly from NTIS. Grove no longer sells microfiche, but sells information on CDROM instead.

You can query FCC databases directly from this web page: http://www.fcc.gov/searchtools.html

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on both floppy disks and CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100.

The PerCon Spectrum CDROM sells for under $30 and contains a handful of fields for every FCC license in the US. However, Public Safety license information contained in the Winter 1996 Spectrum doesn't appear as up to date as in the 1997 Police Call Plus.

Spectrum works in DOS, Windows, and Mac environments. One can try restricted sample searches of the Spectrum CD for free via PerCon's web page at http://www.perconcorp.com/db_srch.htm .

Companies have appeared which are "plugged into" the FCC licensing system and they sell computer time allowing on-line file access. They also sell paper copies of FCC information. Washington Radio Reports is one example. A monthly publication, it lists license applications made to the FCC. A few members of my scanner club subscribe and share the information with me.

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country since 1994, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a beautiful 11" by 17" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc. See http://www.megsinet.com/~parnass for a sample.

RadioMap has been advertised monthly in Monitoring Times magazine since 1995. The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $10.00, the deluxe report includes and extra index sorted by frequency and a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $39.95 for deluxe RadioMap report with histogram and additional index by frequency. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

Web Sites

If you have access to the World Wide Web, you can visit dozens of sites with local frequency lists. You can look up civilian aero frequencies for specific airports at: http://www.airnav.com/airports/.

Other frequency web sites include:
http://w5gb.nmsu.edu/kc5kto/,
http://www.fordyce.org/scanning/, and
http://www.scannerway.8m.com.

Federal Radio Stations - Not Licensed by FCC

Since federal government radio stations are not licensed by the FCC, they are not listed in FCC microfiche. In 1981, a group of 60 radio hobbyists split a $1300 fee, and obtained 80 microfiche cards of 'sanitized' information about federal government radio stations under the Freedom of Information Act (FOIA). (See "The Government Giveth, the Government Taketh Away", by Richard Prelinger, in Monitoring Times, July 1982.)

Only 12 of the 21 information fields for each station were furnished. Fields like "Remarks", which indicate the exact usage of a channel (e.g. "Sky Marshall's Net"), and "Bureau", indicating agency subdivision (e.g. TAC within the USAF), were withheld. These 80 pages of microfiche were sold by Grove Enterprises for $25, but are no longer available from that source. Private entrepreneurs have been known to ask $125 or more for a set! In a step backward, the US Government insists it will no longer release this type of information - it is now 'classified'.

(See "AFIO and the FOIA", by Bob Grove, in Monitoring Times, September 1982.)

For a reason unknown to this author, the government released a 1984 vintage set of frequencies allocated to the FAA. Perhaps this was a mistake, because the information is marked 'unclassified', but all fields are furnished, including some which indicate security related usage. Grove sold this set of 33 microfiche cards for about $13.

Two way radio equipment formerly used by the armed forces often appears for sale at hamfests. Less often, Secret Service and FBI radios appear there from time to time, too. When you see such equipment, look over the radio for a frequency label and write down the frequencies stamped on the crystals or channel elements. Make note of any service or property tags which specify the agency or military base which used the equipment.

Radio Clubs

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than a pile of magazines.

Since the early 1960s, I had been an amateur radio operator, and belonged to amateur radio clubs, but I never realized there were any scanner clubs! In 1983, I joined the world's largest scanner club, the Radio Communications Monitoring Association (RCMA), now out of business. There are several regional scanner clubs, spun off from the former RCMA, which hold regular meetings.

Another club which prints sensitive federal frequencies is the All Ohio Scanner Club. I enjoy its bimonthly publication, The American Scannergram, which is about 60 pages long. Although concentrating on Ohio, there is frequency information from other states, and plenty of product reviews and scanning tips.

More information is available on the WWW page http://aosc.rpmdp.com and from:

All Ohio Scanner Club
50 Villa Road
Springfield, OH 45503

Do Your Own Sleuthing

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of

information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

What Makes Station Identification Difficult?

In most instances, FCC rules require radio users to identify their operations with FCC assigned call letters. Police and fire departments, especially those with trained radio dispatchers, seem particularly conscientious about station identification. Like commercial broadcasters, many of these stations identify on the hour and the half hour.

Some repeater stations have Morse code identification circuits which transmit call letters on a periodic basis, insuring compliance with FCC rules.

On the other hand, over 75% the industrial radio stations monitored within the last year ignore the FCC regulation, making it difficult for a listener to identify a station. Some stations may operate for years using the nondescriptive "base to mobile 2" or "Joe to base" protocol. One rung up the hierarchy are stations that identify using something like "Acme base to 107", giving the listener a clue for his log. If call letters are given, they are often rendered unintelligible by operators who fail to enunciate. The failure to identify is more likely due to sloppiness, rather than any attempt to hide station identity.

While not regulated by the FCC, federal government radio stations vary in the extent to which they identify their transmissions. Some federal stations do not have call letters. A nearby paging transmitter periodically transmits a voice recording announcing, "This is the Army

Joliet Ammunition Plant." What more could a listener ask for?

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy. I use two modified Radio Shack CTR-75 recorders, a discontinued model.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

If you don't have a VOX recorder, consider a device like the NiteLogger II tape recorder controller, made by Benjamin Michael Industries. It connects simply between scanner and recorder and contains sound activation circuitry to trigger the recorder.

The following examples illustrate techniques I've used to derive new frequency information.

Examine the FCC License on Premise

I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the Bell Labs security office and the guard shack at Waste Management's Greene Valley Landfill in Naperville.

Examine the Labels on Radio Equipment

Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find Dymo or P-Touch tape labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret.

- At the annual Glenview Naval Air Station open house, I examined a military manpack radio being used by dispensary paramedics. The radio's tuning dial was set at 34.15 MHz.

- The Illinois Army National Guard displayed two armored personnel carriers at the local county fair, each

equipped with VHF-FM and HF-SSB transceivers.

In addition to a tuning control (VFO), the VHF-FM radio had a set of channel select pushbuttons, much like those in a car radio. I asked a guardsman a few questions about the radio, and he demonstrated the channel preset feature. A panel above the channel pushbuttons was labeled with the frequencies: 32.055, 34.45, 35.35, 40.55, and 40.60 MHz.

- An Army National Guard UH1 helicopter was displayed at the Marseilles armory "open house". The public was permitted to climb aboard, and observe the instrumentation and radio gear. A channel plate on the instrument cluster listed over a dozen frequencies.

Hobbyists are urged to exercise a modicum of restraint and good judgement. In New Jersey, a radio technician/hobbyist called to service a transmitter in a county building, noticed a new unattended repeater installation in the same room. Being curious about what frequency this repeater was on, he opened the access door to copy the frequencies from the radio's crystals. It turns out that this radio belonged to the US Secret Service, and opening the access door could have activated a "tamper alarm"!

The tech was skating on thin ice. He had nobody's permission to tamper with that equipment.

Another source of frequency information is as close as your nearest Radio Shack store. Some Radio Shack stores make a local frequency list available to assist their scanner customers. Be sure to ask. Stores located in shopping malls almost always know the mall security frequencies. I often check the frequencies programmed into the floor model scanners, too.

Examine the Antenna to Determine Frequency Band

You can often determine a transmitter's frequency band by the size and type of antenna used.

The Police Call Plus book contains sketches of antennas. Antenna catalogs are crammed full with antenna pictures and specifications and they are usually free. Contact Antenna Specialists (216-349-8400), Cushcraft (603-627-7877), Tessco (800-472-7373), Maxrad, Larsen Electronics (800-426-1656), and other companies in the land mobile equipment business.

Equipment to Determine Frequency Usage

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. Some models, including the Radio Shack PRO-2035, ICOM R7000/R7100, Bearcat 2500XLT, and Bearcat 250, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, another spectrum analyzer connected to a receiver IF stage, and a frequency counter for close-in work.

How Can I Determine To Whom I'm Listening? - An Example

While scanning the industrial frequencies in the 150 MHz range, a van driver was overheard communicating with "base" while driving around my town. The stations involved never used FCC call signs -- this would have made life a lot easier for me, and legal for them! (one may use FCC license microfiche, described earlier, to identify stations using call letters.) Transmissions were short and infrequent, so it was decided to tape record all transmissions on this frequency for several days to determine the station's identity.

During daylight hours, a modified Regency K500 scanner was left tuned to the target frequency, connected to a cheap tape recorder through a home built interface. Using a carrier operated relay, the tape interface supplied power to the recorder only during radio transmissions, so a day's worth of traffic could be compressed into a 45 minute tape.

Each day, the tape was played back and notes on names, locations, and activities mentioned during the day's transmissions were taken. The van driver appeared to be making daily stops at a local bank and two shopping malls. A Walgreen's store seemed to be the only stop at one mall. A few times, "base" ordered the van "back to the Training Center." There were frequent references to "guests checking out", "dropping a guest off", and "instructor[s] missing a class". At times, "base" spoke with "security", who must have been using a walkie-talkie as his signals

weren't strong enough to hear.

Was this a hotel? Calls to the three local hotels revealed that none provides shuttle bus service to the shopping malls. A call to the Walgreen's, inquiring about bus service to the store, drew another blank. During my shopping trips, I began to pay closer attention to vans with antennas driving through the parking lots.

I was leaving the mall one day, when a week's effort paid off. A maroon and white van, equipped with a VHF-Hi antenna, was dropping shoppers off at Walgreen's. A sign on the van's door read:

XYZ Central Training Center (XYZ is a pseudonym for the actual licensee name.)
Lisle, Illinois

I watched the driver pick up a microphone, and listened to him on my portable scanner checking back with his "base".

All the pieces fit: the "guests", the "classes", the "instructors". Mystery solved; I had been monitoring the customer training center for a large computer manufacturer. The training center has hotel rooms and dining facilities to accommodate students from out of state. As a convenience, shuttle van service is provided to local shopping malls.

Summary

Through books, government records, and radio clubs, scanner listeners can make use of frequency information compiled by others. Two-way radio users often fail to identify their transmissions properly, making it more difficult for listeners to know who they are monitoring. By examining radio equipment labeling, and monitoring and taping transmissions, scanner enthusiasts can unearth new information.

BUYING A USED SCANNER RADIO

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET groups
rec.radio.scanner, alt.radio.scanner, and rec.radio.info.
It is also available electronically from the
rec.radio.scanner ftp archive on the official USENET FAQ
library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

Abstract

This article discusses the purchase of used scanner radios
and includes these topics:

1. Motivation for buying a used scanner
2. A used scanner may be a broken scanner - where to get
it fixed
3. Evolution of the scanner
4. Obtaining crystals
5. Keyboard programmable scanners

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

Introduction

Anybody with enough money can buy a brand new scanner, but
you can save lots of money if you get a good deal on a used
scanner. Hamfests are probably the best place to find used
radios, but you must be familiar with the equipment.
Hamfests are repleat with older radios you won't see in
today's catalogs.

At last count, there were over 140 scanners and monitor
receivers of various brands in my collection. I purchase
most of my receivers at hamfests or horsetrade with other

radio hobbyists.

Uniden sells refurbished scanners dn you can check current inventory at their web site:
http://www.uniden.com/docs/store

A Used Scanner May be a Broken Scanner

Getting a bargain is not without some risk. I have had sellers look me square in the eye and tell me their radio worked fine -- when it really didn't.

Buying a used portable scanner is riskier than buying a mobile or base model. Portable scanners are subject to more physical abuse and many have been dropped. If a radio has been dropped, the laws of probability dictate that the first point of impact was probably a corner, so be sure to examine each corner for evidence of trauma.

Scanners used in mobile service are subject to vibration, dust, and temperature extremes. This shouldn't dissuade you from buying a used mobile scanner, but be aware of possible complications.

You should have some recourse if the radio you buy turns out to be defective. For hints on fixing older Bearcat base scanners, see "Tips for Fixing Bearcat Scanners," by Bob Parnass, AJ9S, in March 1996 Monitoring Times magazine.

If you can't fix the radio yourself, you can pay to have the manufacturer or a service clinic repair it for you. Radio Shack repairs scanners, and Uniden can repair newer Bearcat models but often refuses to service older models, claiming they are "unrepairable" and carving the letter "U" on the cabinet.

G & G Communications (telephone 716-768-8151) is a family owned company which repairs scanners and stocks parts and crystals for several older models. They usually don't repair AOR scanners due to lack of manufacturer support. They are located at 7825 Black Street Rd., LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

The re-incorporated Electra Corporation, (317)326-4419, is able to effect repairs on some older (pre-Uniden) Bearcat scanners. They sell crystals, antennas, power cords, owner's manuals ($11 ea). Electra Corporation is located at 251 N. 300 W. Greenfield, IN 46140-8496.

You may be able to obtain manuals for older Midland scanners from:

Midland Consumer Radio Products
1670, North Topping,
Kansas City,
MO: 64120
Phone: 816-241-8500

Evolution of the Scanner

It helps to understand some scanner history before shopping for a used scanner. You will likely see radios from many vintages at a hamfest, and should avoid buying early units unless you are a scanner collector.

One of the earliest ancestors to the scanner was the converter. Manufactured by Tompkins (Tuneaverter), Petersen, Bearcat (Lil Tiger), Midland, and others, converters were made to operate in conjunction with AM radios. Then came wide band monitor receivers, in both tunable and crystal control models, like the Radio Shack PRO-2B. Truthfully, converters and tuneable FM receivers are interesting but don't work well by today's standards.

While tuneable receivers were in vogue, solid state technologies supplanted tubes. Better performing, narrow band crystal controlled units, like the Sonar FR-105, followed. These units did not scan, rather channel selection was accomplished using a simple rotary switch. Sonar even made a 24 channel unit, model FR-2513, in which crystals were held in a rotary "turret."

The earliest scanners, like the 1968 vintage Bearcat BCH, BCL, and BCU models, did not provide individual channel lockout capability. Electra didn't use the term "scanner" and instead called these innovative radios "business receivers." Other models, like the SBE Sentinel, employed a "Channel 1 Bypass" switch so a user could lockout channel 1.

The first scanners came in single band models, followed by multiband models. As two-way radio users started to populate the 450 - 470 MHz band, consumers were forced to pay a premium for UHF scanner coverage. Some multiband scanners, like the Electra's Bearcat III, required an optional circuit board for each band.

There were scanner mutations, designs which never evolved -- odd combinations of AM broadcast receivers with VHF-FM receive capability, like the flamboyant turquoise Sonar Sentry FR-103 portables, Electra's Jolly Roger, and GE's Surveyor series (see US patent 4,011,515, granted 3/8/77). Lafayette Radio Electronics offered a few CB transceivers with VHF receiver capability. These poor performers didn't interest consumers of that era and you should avoid these models unless you are a scanner collector.

The first programmable (crystal-less) scanners were difficult to program. Users had to look up frequencies in a code book and tediously program the information into the scanner in binary form. Some models, like the Tennelec MCP-1 (see US patent 3,961,261, granted 6/1/76), Bearcat BC-101 (see US patent 4,179,662, granted 8/4/78), and Radio Shack COMP 100, resembled Altair or PDP-8 computers, with a row of 16 or so toggle switches. Instead of toggle switches, the Regency WHAMO-10 was programmed by breaking teeth from metal combs. See US patent 4,057,760, granted 11/8/77. The GRE-manufactured SBE Optiscan (and its Sears clone) required poking or covering a series of holes in plastic cards which were then inserted into a slot on the front panel.

Keyboard Programmable Scanners

Both Bearcat and Regency, as well as Radio Shack offer some good models. I would avoid the Bearcat 100, and older scanners made by AOR, JIL, Fox, Tennelec, and Robyn.

Scanner features often differ not only by model but by manufacturer. For instance, most Radio Shack and Bearcat programmables allow enable/disable of the delay function on a per-channel basis. Older Regency units permit the delay to be enabled/disabled only globally, that is, for all the channels at one time.

All the older Radio Shack scanners were made by General Research Electronics (GRE). Uniden began making scanner models for Radio Shack in the late 1980s, and now supplies about half the Radio Shack scanners. The older GRE-made models scan a bit slowly and have a higher level of synthesizer noise. Most have too much hysteresis in the operation of the squelch control, but this can be fixed completely by replacing one resistor. Good, detailed shop manuals are available for Radio Shack units for $5 - $12.

In the name of cost cutting, some models have done away with the concept of a "channel bank", i.e. the ability to select/deselect a group of channels at a time. The bank concept was a good one. It may be inconvenient to operate a 30 channel scanner without banks (e.g. Regency MX3000, HX1000) if you operate the way many scanner hobbyists do.

If you want to buy an American-made scanner, you will have to buy an old model. Until the mid 1980s, rivals Regency and Electra (Bearcat) built most of the scanners in their Indiana and Puerto Rican factories. Uniden, a large Japanese electronics company, purchased the scanner product lines of both competitors and moved production to Asia.

My favorite VHF/UHF receivers are the the Uniden/Bearcat BC9000XLT, the 400 channel Radio Shack PRO-2005 and PRO-2006, and the ICOM R7000, R7100, and R8500. The ICOM models are more "communications receiver" than a conventional scanner.

For portable use, I prefer the ICOM IC-R2, Uniden/Bearcat BC3000XLT, and older Radio Shack PRO-43.

Obtaining Crystals

If you do purchase a crystal controlled scanner or monitor receiver, you will probably want to buy more crystals to cover local frequencies.

Scanner crystals may be ordered from your local Radio Shack store or from one of the companies below. Be sure to specify the operating frequency you want and the brand and model of scanner.

Some companies may ask you to send a schematic of the scanner or require more detailed information, like series or parallel resonance, load capacitance, etc.

Electra Corporation stocks crystals for the Bearcat scanners:

Electra Corporation
11915 E. Washington St.
Cumberland, IN 46229
Phone 317-894-3229

Crystals for Bearcat and other models are available from:

American Crystal Co.
1623 Central Ave.
Kansas City, KS 66102
tel. 913-342-5493

Bomar Crystal Company
201 Blackford Ave.
Middlesex, NJ 08846
tel. 908-356-7787

Cal Crystal Lab Inc.
1142 N. Gilbert St.
Anaheim, CA 92801
tel. 714-991-1580

International Crystal Mfg Co.
11 N. Lee Ave
Oklahoma City, OK 73102
tel. 405-236-3741, 800-725-1426

G & G Communications
9247 Glenwood Drive
LeRoy, NY 14482.

REPAIR TIPS: BEARCAT SCANNER RADIOS

Copyright 1993 - 2001 by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner,
sci.electronics.repair, and rec.radio.info. It is also
available electronically from the rec.radio.scanner ftp
archive on the official USENET FAQ library
ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.
The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.]

Introduction

The original Bearcat scanner line was manufactured by
Electra Company, a division of Masco Corp of Indiana. In
the mid 1980s, Uniden, a Japanese company, bought out the
Bearcat scanner line and Uniden's first Bearcat scanner was
the BC800XLT model.

Most of the models discussed in this article are
base/mobile units made by Electra during the 1970s and
1980s although some of the capacitor failures occur in the
Uniden BC800XLT, too.

Electra stamped all of its scanners with a manufacturing
date code on the rear of the cabinet. The code is comprised
of a single character (C = Cumberland, Indiana, P = Puerto
Rico), followed by four digits denoting year and week the
radio was built. For example, "P8422" denotes the radio was
made in the Puerto Rico factory during the 22nd week of
1984.

One way to roughly estimate a radio's age is to examine the
4 digit date codes often stamped on the integrated
circuits. The radio must have been made after the most

recent date stamp.

Schematics, Owner's Manuals, and Parts Available

The re-incorporated Electra Corporation sells crystals, antennas, power cords, owner's manuals ($11 ea) for some older (pre-Uniden) Bearcat scanners. Electra Corporation is located at 11915 E. Washington St., Cumberland, IN 46229. Phone 317-894-3229, email: electra@tcon.net,

I cannot furnish schematics, manuals or parts. To order a user manual for an Electra/Bearcat scanner from Uniden, call (800)235-3874 extension 2553. You can also download an electronic copy of the user manual for recent Bearcat models from the Uniden web site:

http://www.uniden.com/docs/service/support.htm

Some schematic diagrams may be obtained from Uniden's parts department, (800)297-1023. Uniden currently charges a flat rate of $54 for scanner repairs. They will repair and return "out of warranty" items without an estimate unless the repair charges exceed the flat rate charges.

The phone number for repair is (800)297-1023, too. I recommend you call repair before sending the broken scanner. Items for repair via UPS (include receipt if still under warranty) are usually sent to:

Uniden America Corp.
4700 Amon Carter Blvd.
P.O. Box 95002
Fort Worth, TX 76155

If Uniden doesn't have a schematic, try obtaining a Photophacts from Howard Sams Publishing division of Prentice-Hall at (800)428-7267, http://www.samswebsite.com

G & G Communications (telephone (716)768-8151) is a family owned company which repairs scanners and stocks parts for several older models, especially Electra/Bearcat and Regency brands, but they don't sell manuals or schematics. They are located at 7825 Black Street Rd., LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

Common Construction

Most of the classic, metal-cased Bearcat base/mobile models were built using two printed circuit boards:

1. a "radio board" containing the synthesizer, RF, IF, and audio stages, and
2. a "feature board" containing the microprocessor

controller and memory circuitry which gave each model its own personality.

Although there are various vintage radios boards, they all have similar circuitry.

Bad Solder Joints Common

Before addressing specific symptoms, circuit boards in the malfunctioning scanner should be inspected for poor solder joints.

The Electra/Bearcat BC350, BC300, BC250, BC220, BC20/20, BC211, BC210, and BC210XL models were hand assembled, and every one I've serviced had several connections that were either soldered poorly, or not soldered at all.

Resoldering joints on the ribbon cable connecting the RF and keyboard logic circuit boards in a BC250 attenuated the microprocessor/synthesizer hash noise noticeably.

A Bearcat 20/20 was experiencing periodic loss of memory on some, but not all channels. When the problem occurred, the frequencies on some channels would be completely changed. On other channels, the frequency would still be intact, but the channel would be locked out, and the delay toggled from "on" to "off". Some channels were not affected.

The 2 "AA" memory backup batteries, and their holder, tested good. Much time was spent tracing logic, heating and cooling components, and making voltage measurements.

One of the secondary leads from the power transformer was connected to the main circuit board through a hole drilled through foil traces on both the top and bottom sides of the board. A close examination revealed that this lead had been soldered only on the top of the board - the bottom side had never been soldered.

Soldering the lead on both sides of the board solved the memory loss problem.

Matt Roberds fixed a BC220 which experienced memory loss if power was removed by resoldering the positive wire to 2-AA battery holder.

As built, the BC220 logic board is grounded only through its mounting screws. In the BC220, Matt recommends adding real wire ground jumpers from the main board to the feature (logic) board to fix grounding problems.

Symptom: Blank Display

The BC300 scanner, and several other Bearcat models, employ a switching type power supply stage to generate plus and minus voltages in excess of 20 volts DC. When this switcher fails to function, the display goes blank, but the squelch control appears to work, and white noise can be heard in the speaker.

In almost a dozen of the BC300 and BC800XLT scanners I've fixed, C98, a capacitor in series with the primary of the switching transformer failed, causing the output of the supply to drop below the level needed to power the display. The switching transformer is mounted on the RF circuit board, and is much, much smaller than the main power transformer, which is usually fastened to the metal chassis. See March 1996 Monitoring Times magazine for BC800XLT capacitor locations and repair information.

The 22uF/16V capacitor used for C98 in early BC300s was marginal, and was replaced with a 47uF/25V capacitor in later units.

Jim Craig and Karl Klein repaired their BC210XWs by replacing the 22uF/35V C98 capacitor.

Paul Grohe replaced a failed C98 with a low ESR (equivalent series resistance), high frequency, switching regulator grade capacitor, e.g. a Panasonic HF series capacitor. He also recommends adding a 0.1 ceramic capacitor in parallel with C98.

I replaced the 22 uF capacitor in the switching power supply stage of a BC210XL which caused the same symptom. Other capacitors in the switcher stage have failed. C114, a 4.7 uF/35V tantalum capacitor failed in at least one BC250, causing the display to blank.

A more sinister problem affects the switcher in earlier models. The switching supply stage in the BC250 and original BC210 is driven by a clock signal derived from a custom Exar NC57902 divider integrated circuit (designated IC6 in the BC250 scanner). I've seen this divider IC fail in several BC250s, causing a blank display (except for a decimal point in the BC250's rightmost digit). This custom IC is no longer available from Uniden.

Failure of IC9, the 9 volt NJM78M09A regulator in a BC800XLT is another cause of a blank display.

Symptom: Invalid Frequency Displayed

A common Bearcat 250 malady is manifested by an invalid frequency displayed on the readout. This display is temporarily "cured" by unplugging the AC line cord from the wall, then replugging it. This condition is symptomatic of

a power supply problem in which Q204, a Texas Instruments TIP-29 located on the feature circuit board, fails.

A Philips ECG291 will work as a substitute for the TIP-29. Don't try a Radio Shack substitute, it hasn't worked. See Martin Toomajian's article, "Bearcat 250 Erratic Display Cure", in January 1987 Monitoring Times.

A similar problem in the Bearcat 20/20 was discussed previously in the section on bad solder joints.

Matt Roberds repaired the Montgomery Wards version of a BC220 and contributed these insights:

"I did add some heat-sinks, but you have to be careful what you do with the TIP29 on the logic board. I added a long, flat heatsink to it and immediately created a whine in the audio. I didn't use an insulator, as this was a temporary first-try. As far as I can tell, the heatsink was radiating noise from the logic board into the front end on the radio board, which ended up being just below the heatsink. Bypassing the TIP29 (a voltage regulator) with disc ceramics didn't work; using a smaller heatsink and an insulator fixed the problem."

"There is also a 220 ohm 1/4 watt resistor on the logic board. It feeds the TIP29 from the main +16v supply. It looked a little crispy. I pulled one end and measured the current through it and it was about 30-35 mA. This works out to right at 0.2-0.25 watt dissipation. I didn't have a higher-wattage resistor, so I substituted 2 470-ohm resistors in parallel."

Symptom: Squelch Won't Eliminate White Noise

Most Uniden/Bearcat base/mobile scanners feature an AUTO squelch position, actuated by rotating the squelch knob fully counter clockwise. The BC350 used a separate pushbutton switch for this purpose. These scanners use a flimsy potentiometer (designated R81 in BC300s) internally mounted on the RF circuit board, to set the level of signal required to open the squelch when in the AUTO position. This pot also has an effect on the squelch action in the non-AUTO mode, and determines at which point the squelch knob must be positioned in order to silence the radio.

Although the potentiometer is adjusted at the factory, changes in component values due to aging often necessitate readjustment of this internal pot. Misadjustment of this pot has been the cause of "no squelch" complaints in two BC300s and a BC250 I fixed.

Another squelch failure is due to a blown transistor that acts as the electronic switch in the squelch circuit. I replaced this transistor in only one BC300, so I don't know if this is a common problem.

Symptom: Scanner Completely Dead

In Bearcat scanners using an internal power supply (e.g., BC350, BC250, etc.), the main power transformer is connected directly to the AC line. Since the on/off switch is on the secondary side of the transformer, current flows in the primary as long as the AC line cord is plugged into an active AC outlet. These transformers contain an internal circuit breaker, not visible without unwinding (destroying) the transformer. The internal breaker is known to fail prematurely in a batch of Bearcat power transformers.

If your scanner is completely dead, check the primary of this transformer for an open circuit condition.

Symptom: Keyboard Bounce

After much use, the Chromerics keyboards in Bearcat scanners start to wear out. The first sign of trouble is usually keyboard bounce on the most frequently used key, e.g., the MANUAL key. Replacement keyboards are usually available from UNIDEN, but replacement requires dexterity, as one must take care not to tear the flat, flexible strip connecting the keyboard to the logic board.

Symptom: Keyboard Completely Unresponsive

The keyboard matrix is "scanned" by the microprocessor. Another problem is when none of the keys seems to function; the receiver just keeps scanning in spite of key depressions. I found this condition in a BC210XL scanner owned by a heavy smoker. Perhaps nicotine smoke was to blame, as the resistance between two input port pins on the microprocessor was down to about 1000 ohms, fooling the microprocessor into believing that a key was stuck in the "down" position. Scraping the circuit board between the two pins with an X-Acto knife fixed the problem.

Uniden/Bearcat BC200XLT Portable
Loss of Audio and Dial Lamp

If you can program frequencies into your BC200XLT but there is no audio and the green backlight no longer functions, a tiny transistor may have failed.

Check for a defective PNP surface mount transistor, Q201 (2SB815B6-YDY). Q201 is used as a switch to furnish 8 VDC to several stages of the BC200XLT. Its main purpose is to

switch off power hungry stages of the BC200XLT when the CPU thinks the NiCd voltage has fallen below a threshhold. That's an attempt to limit the current drain on weak NiCds to avoid permanent damage.

Q201 is located on the foil side of the "Micom" board, adjacent to the black multi-pin connector which mates the Micom and main boards together.

Q201 can be destroyed by a few different causes, primarily, by something in the scanner drawing too much current through it. In one case, capacitor C36 shorted. It's a 220 uF 10v electrolytic, located on the component side of the main board, connected from pin 8 of the audio IC (IC2 NJM386SL) to ground. Capacitor C55 shorted in another BC200XLT. Gary Bean reports he substituted a 2SA1298 for Q201 and it worked fine. In a pinch you bypass Q201 by soldering a short piece of bare wire between the collector and emitter, but you must first fix the component which caused Q201 to fail.

BC9000XLT: Loss of Sensitivity

John Ward has fixed two BC9000XLTs which suffered from "low sensitivity." He fixed the solder joint where the antenna jack connects to the circuit board. In both cases the tab from the board was on the opposite side of the jack from where the little blob of solder applied at the factory was located.

It was an intermittent problem that depended upon the position of the antenna cable - if the weight of the cable placed tension on the jack in one direction contact was made and the radio worked fine. If the cable placed tension on the jack in the opposite direction contact was lost and so was reception. The gap was barely noticeable.

Other Problems

Complaints of low audio output and occasional microphonics in three Uniden/Bearcat 800XLTs were caused by a bad 47 ufd electrolytic capacitor in series between the external speaker jack and audio amplifier.

Andy Domonkos reports he often uses a tape recorder connected to a Uniden/Bearcat BC890XLT. RL-1, the carrier activated relay inside the BC890XLT wore out. Andy found the identical relay sold at Radio Shack (part #275-232) and says the BC9000XLT uses the same relay, too.

Replacement Bulbs for BC760XLT

The Uniden BC760XLT's SCAN, MAN, PRI, and HOLD buttons are illuminated by "grain of wheat" type incandescent bulbs. Gary Saffer reports that the bulbs and buttons are located on a small printed circuit board which sits behind the radio's face plate. Gary unsoldered the burned out bulbs in his radio and replaced them with 12 volt Radio Shack bulbs (#272-1092c). They should last a long time when powered by the 8 VDC supplied by the BC760XLT.

Open Resistor in BC140

Robert Casey fixed his deaf, 16 channel Bearcat BC140 scanner. A 10 ohm resistor had opened that fed a circuit that generates 22V for the varactor diode tuner circuits. Without the 22V, there was no tuning of the local oscillator and front end, and no reception. What he did was compare voltages to a second working BC140.

Sources for Replacement NiCd Battery Packs

Replacement NiCd battery packs and inserts for the BC100XLT, BC200XLT, BC2500XLT, BC3000XLT, and other scanners are available from Uniden. I've purchased them at lower cost from:

1. Mr. NiCd - E. H. Yost and Company, 2211-D Parview Rd., Middleton, WI 53562. tel. (608)831-3443. email ehyost@midplains.net

2. Battery-Tech Central, 2818 Southland Street SW, Cedar Rapids, IA 52404-4141. tel. (800)267-3087 or (319)364-0855.

Batteries Plus has stores across they country and some have rebuilt Uniden NiCd packs for under $20.

You can only say that Koresh and crew wanted an inferno if you accept the FBI version. I don't. I have spoken with some of the Davidian's, including one who was there, and they say that they didn't want an inferno, nor were they expecting the raid. Add to that the litany of lies told to get the warrants and military training, the missing door and other abuses, and I can only conclude that the Government did not raid the commune, they illegally assaulted it and reaped the reward of that miscalculation. They did then scramble to cover their butts, and did, IMHO cause the unwarranted deaths of innocents, and doctored the evidence they presented to investigators.

Add a Plectron or Motorola Alert
Desktop Monitor Receiver
to Your Scanner Collection

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner, and
rec.radio.info. It is also available electronically from
the rec.radio.scanner ftp archive on the official USENET
FAQ library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

In the 1960s and 1970s, thousands of firemen and ambulance
squad members came to rely on their crystal controlled,
transistor Plectron and Motorola desktop monitor receivers.
They have now been replaced by battery operated portable
pagers, and the desktop models are often available at
hamfests in the $5 - $25 range. Since many are in rough
condition and need repair, a hamfest special is better
suited for hobbyists who like to fix their own radios.

Plectron and Motorola crystal controlled receivers are
excellent for dedicated monitoring of local frequencies --
a task for which you wouldn't want to tie up your 400
channel programmable scanner. They are desktop models
which can be powered from 117VAC or 12VDC with the proper
mobile cord. The audio quality of a Plectron P1, Plectron
700 series, and Motorola Alert Monitor is far better than
any consumer grade scanner and the sensitivity, image
rejection, and intermod immunity is outstanding when
aligned properly.

Models and Frequency Coverage

The Plectron and Motorola Alert monitors are single band
receivers: VHF-low, VHF-high, or UHF. No single Plectron
or Motorola Alert monitor can cover the entire 30-50 MHz

band, so there were versions optimized for each portion of the VHF-low band. There were different versions to cover low and high "splits" in the VHF-high band, too. For example, low band R8000s come in 30 - 35, 35 - 39, 39 - 49, and 49 - 54 MHz versions. There are two VHF high band versions of the 700 and R8000: 148 - 158 and 158 - 175 MHz.

VHF-low band Motorola Alert monitors come in two splits: 30 - 42 and 42 - 54 MHz.

Although UHF versions of the 700 series were made, they are somewhat rare and coverage is limited to 470 MHz and below.

Plectron made several models with dozens of different options. Both the original P1 and later 700 series are suitable for restoration, although I prefer the newer 700 models. The 8000 series were even newer and very desireable, but they are difficult to find at hamfests. The Plectron 500 "economy" series is less desirable.

The P1 series have black cabinets with a blue-green and silver color scheme used on the front panel. They were made in the Chief (tone decoder & carrier squelch), Patrol (carrier squelch only), and Sentry (tone only) models. The Sentry models lack a carrier squelch and therefore are of little use to hobbyists except for scavenging parts. Model number and frequency information appears on a gummed label on the rear panel:

Band (MHz) Chief Patrol Sentry

_____
25-54 R19 R15 R17
148-174 R20 R16 R18
450-470 R23 R21 R22

Table 1. Plectron P1 models

The R700 series have black cabinets with brown front panels and are slightly smaller than the P1 receivers. R700s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

_____
25-54 R719 R715
148-174 R720 R716
450-470 R723 R721

Table 2. Plectron 700 models

The R8000 series are much smaller than the P1 and R700 and are housed in metal cabinets of various colors. The R8000s use the same MC3357 IF/detector/squelch IC used in crystal

scanners, but their crystals are not interchangeable with ordinary scanners. R8000s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

30-54 R8190 R8150
148-174 R8200 R8160

Table 3. Plectron 8000 models

The Plectron FM Receiver/Recorder is a collector's item. It is essentially a 700 series Chief receiver with a built in cassette tape recorder. The recorder is carrier activated and can tape transmissions while the receiver is unattended. A connector on the rear panel allows for all kinds of remote control possibilities.

The tape recorder inside the Receiver/Recorder employs two rubber belts. The Projector Recorder Belt Company makes replacement belts which work fine, though they may not be the original equipment:

1. PRB SCA8.6 (218 mm)
2. PRB SCQ 2.5 (64 mm)

I use two Plectron P1s and four R700s in my living room, seven R700s down the basement, and several Plectrons and Alert Monitors stored in reserve. The basement Plectrons are turned on automatically when someone walks downstairs. Power to them is controlled by a modified Radio Shack Safe House infrared motion detector, originally sold as an intrusion alarm.

When a rescue squad member from Missouri advertised a number of Plectrons on USENET, I bought them -- all 20+ of them. I cleaned, fixed, and restored each one. After recrystalling them on local frequencies, I distributed them to members of my scanner club who were glad to get them.

Crystals

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency.

The best source for crystals is:

International Crystal Mfg Co.
11 N. Lee Ave
Oklahoma City, OK 73102
tel. 405-236-3741, 800-725-1426

You need not bother with calculating the crystal fundamental frequency. Merely supply International with the exact receiver model number, printed on the rear label, and the frequency you want to monitor. They will perform the necessary calculations.

Crystals for Plectrons

The Plectron P1 series contain two crystals. The second local oscillator crystal is 11.155 MHz regardless of band. On VHF high band (148 - 175 MHz), the P1 series employ this formula for the first local oscillator crystal:

Crystal frequency (MHz)
= (station freq (MHz) + 10.7) / 4

or

Crystal frequency (MHz)
= (station freq (MHz) - 10.7) / 4

On VHF low band (25 - 54 MHz), the P1 series employ this formula for the first local oscillator crystal:

Crystal frequency (MHz) = (station freq (MHz) + 10.7)

or

Crystal frequency (MHz) = (station freq (MHz) - 10.7)

There are two crystals (Y1, Y2) used in the Plectron R700 series, one for each local oscillator. The crystal formulas are:

RF Range (MHz) Y1 (MHz) Y2 (MHz)
_____
25-29 (f+10.7)/3 11.155
29-32.6 (f+10.7)/3 11.155
32.5-35 (f-10.7)/2 10.245
35-41 (f-10.7)/2 11.155
41-47 (f-10.7)/2 11.155 (use 10.245 MHz
for Y2 on 44.62 MHz)
47-54 (f-10.7)/3 11.155
148-158 (f-10.7)/9 11.155
158-175 (f-10.7)/9 10.245
450-470 (f-10.7)/18 11.155

The economy Plectron 500 series use this scheme for the first local oscillator crystal:

RF Range (MHz) Crystal (MHz)

---

25 - 35 (f+10.7)
35 - 54 (f-10.7)
148 - 174 (f-10.7)/4

Most Plectron 500s use an 11.155 MHz second local oscillator crystal. However, a 10.245 MHz crystal is used instead for receivers in these ranges: 33.4 - 33.78, 44.62, and 158.78 - 158.82 MHz.

Power Cords

AC power cords for both types of receivers use unique connectors and are scarce. I published the pinout for both Plectron and Motorola Alert Monitor receivers in June 1998 Monitoring Times magazine.

You can buy the proper replacement power cords but it's much cheaper to drill a hole on the rear panel and solder on a permanent a power cord. Make sure you use a grommet in the hole to prevent the metal chassis from chafing the line cord.

Many Plectrons and Alert Monitors were equipped with an internal NiCd battery pack, intended to power the receiver if the AC power fails. It's unusual to find a used monitor receiver with the NiCd pack still capable of holding a charge. More often, the batteries have died and the series charging resistor has overheated and burned. Be sure to remove the dead batteries as they often leak.

Squelch and Minimum Volume Setting

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Both Plectron and Motorola Alert monitor receivers are designed purposely to have a minimum volume setting which is still audible. The intent was to prevent firemen from turning the volume down completely, forgetting it was down, then missing an important call.

This "feature" was usually implemented by having a fixed value resistor in series between one end of the volume control and ground. In the R15X5, R14X5, R15X5, and R16X5, a 47 ohm resistor, designated R624, was inserted in series with the violet wire leading from the volume control.

You could decrease the lowest volume setting by decreasing the value of this fixed resistor. Alternatively, you could replace the resistor with a jumper wire to completely

silence the receiver at minimum setting of the volume control.

Tone Alert Feature

I have not used the Plectron tone alerting features so I cannot address that except to say that the special coils and capacitors for the dual tone decoders vary depending on the tone frequencies and are somewhat difficult to obtain.

Repair and Replacement Parts

Repair service and replacement parts for the Plectron P1 and R700 models is offered by:

Weber Electronics
PO Box 212
5138 Laurel Ln.
Broad Run, VA 20137
telephone (540) 347-7760
email: weber@citizen.infi.net

Alert Monitor parts are available from Motorola. Phone (800)422-4210. The part number on the service manual for my VHF-high band monitor is 68P81048A55-G and my VHF-low band manual bears part number 68P81050A95-D.

John Miller reports the current price is $5.70 for service manuals. Motorola advised John that Alert Monitor parts are scarce, with last stocked being in 1995, Knobs are no longer available, though there are many that would fit.

Plectron SM-series Scanning Receivers

Plectron also sold an SM series of scanners, manufactured in Japan by the same folks who made Craig (division of Pioneer) scanners. The SM series are consumer-grade models and are included in this article for the sake of completeness. They are crystal controlled radios and feature priority scan and a separate trimmer capacitor for each channel to net the crystals on frequency.

Band Frequency Limits

VHF-low 30 - 50
VHF-high 150 - 174
UHF 450 - 470 MHz

Table 4. Plectron SM Model Band Limits

Model	UHF	VHF-high	VHF-low
SM-301	X	X	X
SM-302	X	X	

SM-303 X X
SM-304 X X

Table 5. Plectron SM Models

The crystals used in the SM series are quite different from the crystals used in the conventional single channel Plectron monitors. Here are the crystal formulas:

VHF low band:
crystal 3rd overtone freq = receive freq + 10.7 MHz

VHF high band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz)/3

UHF band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz) /
10

Other crystal specifications for the SM series are:

CR 25/U holder
3rd overtone
20 pF load capacitance
parallel resonant
max series resistance 40 ohm
max drive 2 mW

Plectron Alternatives

Too bad Plectron is out of business. TCS Communications Corp. sells used Plectron receivers, in working condition, for $75-100. If you require crystals or reeds, TCS may be able to find some types/frequencies. Contact:

Terry Marengi
TCS Communications Corp.
tel. 1-800-TCS-XMIT
email: TERRYTCS@aol.com

If you wish to purchase a new receiver with "Plectron-like" signaling capabilities, contact Reach Electronics:

Reach Electronics
1311 West Pacific
Lexington, NE 68850
(308) 324-6661
(800) 445-0007
FAX: (308) 324-4985

Reach sells tone & voice pagers, Alert monitors, and ENCODERS. They also do contract manufacturing.

I currently have no Plectrons or Motorola Alert Monitors for sale. I'm hoarding them. :-)

HAMFEST/COMPUTERFEST CALENDAR 2001 - ILLINOIS
last updated January 3, 2001 |

o Please report additions or changes to Bob Parnass, AJ9S, office phone: (630)979-5414, electronic mail: parnass@bell-labs.com. Thanks to Dennis Dale, Rick D. Wilson, John Wass KA9QJX, Tom Harker, and ARRL for providing some of the information.

JANUARY 2001

Jan 7 (Sun): Wheaton, IL - Giant Computer Show & Sale (see below). DuPage County Fairgrounds, County Farm Rd. & Manchester Rd. 9:30 AM - 3 PM. Adults $6, children $2.

Jan 14 (Sun): Tinley Park, IL - Giant Computer Show & Sale (see below). Tinley Park Convention Center, 185th St. & Harlem Ave. 9:30 AM - 3 PM. Adults $6, children $2.

Jan 28 (Sun): Cicero, IL - WCRA Mid-winter hamfest 2001. Hawthorn Park on S. Laramie Avenue, Cicero, Illinois Note change of venue 2 blocks south of 2000 hamfest! The new location, Hawthorn Race Park, is much nicer than the Odeum. Cleaner, brighter, better food. Tickets $5.00 in advance with 4 stubs. Parking is free. Advance tickets from Kurt F. Rubin, kb9rto@arrl.net and John E. Wiley, K9FID, johnwiley@lucent.com

FEBRUARY 2001

Feb 4 (Sun): Wheaton, IL - Giant Computer Show & Sale (see below). DuPage County Fairgrounds, County Farm Rd. & Manchester Rd. 9:30 AM - 3 PM. Adults $6, children $2.

Feb 11 (Sun): Tinley Park, IL - Giant Computer Show & Sale (see below). Tinley Park Convention Center, 185th St. & Harlem Ave. 9:30 AM - 3 PM. Adults $6, children $2.

Feb 18 (Sun): Tinley Park, IL - Giant Computer Show & Sale (see below). Tinley Park Convention Center, 185th St. & Harlem Ave. 9:30 AM - 3 PM. Adults $6, children $2.

MARCH 2001

Mar 4 (Sun): Wheaton, IL - Giant Computer Show & Sale (see below). DuPage County Fairgrounds, County Farm Rd. & Man-

chester Rd. 9:30 AM - 3 PM. Adults $6, children $2.

Mar 11 (Sun): Tinley Park, IL - Giant Computer Show & Sale (see below). Tinley Park Convention Center, 185th St. & Harlem Ave. 9:30 AM - 3 PM. Adults $6, children $2.

APRIL 2001

Apr 1 (Sun): Wheaton, IL - Giant Computer Show & Sale (see below). DuPage County Fairgrounds, County Farm Rd. & Manchester Rd. 9:30 AM - 3 PM. Adults $6, children $2.

Apr 29 (Sun): Arthur, IL - Moultrie ARK. 8AM - 1PM. Info: | Ralph Zancha, WC9V, PO Box 55, Lovington, IL 61937. Daytime | phone 217-543-2178 evening 217-873-5287. Email: | rzancha@one-eleven.net Or write to M.A.R.K., P.O. Box 91, | Lovington, Illinois, 61937.

COMPUTER SHOW NOTES |

Computer Central computer shows are held at the College of DuPage, Main Arena of the Physical Education Building Park Blvd & College Road, Glen Ellyn, Il. 847-940-7547. $5 admission with card, normal admission $6.00. Opens 9:30 am - 3:00 pm. See http://www.computercentralshows.com web site.

Giant Computer shows are held by Micro Media, Inc. Shows are usually held at the Tinley Park Civic Center, 185th St. & Harlem Ave., Tinley Park, IL or at the DuPage County Fairgrounds, County Farm & Manchester Rds., Wheaton, IL. Admission is $6. Show hours are 9:30 AM - 3 PM. To get on the mailing list or get more information, call (708)974-3123. See http://www.giantcomputershow.com

Computer Country Expo is Lake County's largest computer expo. The event is held on designated Saturdays from 9:30 AM to 3:00 PM. This show features computers, supplies, games, parts, software, accessories, CD-ROM, monitors, diskettes, printers, keyboards, modems, disk drives, cables, expansion boards, services, etc. Lake County Fairgrounds, Route 120 (Belvidere Rd.) & Route 45, in Main Exhibit Hall Building #1=9720,000 sq. feet. For a show map, exhibitor info, and discount coupon, visit the web site at http://www.ccxpo.com.

IMPROVE THE SQUELCH IN YOUR MONITOR RECEIVER

Copyright 1988 - 1999 by Bob Parnass, AJ9S

[NOTE: The first version of this article appeared in the RCMA Newsletter, December 1988. It may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. It is posted twice monthly on the USENET groups rec.radio.scanner, alt.radio.scanner, sci.electronics.repair, and rec.radio.info. It is also available electronically from the rec.radio.scanner ftp archive on the official USENET FAQ library ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.]

The squelch control in some FM monitor receivers is difficult to use because of too much hysteresis. The American Heritage Dictionary of the English Language defines hysteresis as the:

o "Failure of a property changed by an external agent to return to its original value when the cause of the change is removed."

It's like having play in a car's steering wheel, or backlash in a gear set. Too much hysteresis in a squelch circuit forces one to keep the squelch at a tighter setting, missing weaker signals when scanning or searching. The squelch hysteresis problem was first addressed in a 1984 article about the Radio Shack PRO-24 crystal controlled scanner.

Why do engineers design these circuits with any hysteresis? Basically, hysteresis prevents weak signals from "popping" the squelch open and closed rapidly, which would be very annoying to the listener. A squelch circuit with hysteresis requires a stronger signal to open the squelch than it does to keep it open.

Models cursed with too much hysteresis include the Uniden/Bearcat 800XLT and 760XLT, Radio Shack PRO-2003, PRO-2004, and others. Don't despair, the fix is simple for most radios. I've successfully reduced the squelch hysteresis by replacing a single resistor.

Hysteresis is usually implemented by providing feedback from the squelch gate input to output, through a resistor. The higher the resistor value, the less feedback there is, and less hysteresis. My modification involves replacing the "stock" resistor with a higher value resistor, as identified in the table below.

This technique does not apply to some of the newer Uniden models, because the squelch hysteresis is partially determined by firmware inside the processor IC.

This article cannot provide step-by-step instructions for each radio. I always encourage radio hobbyists to purchase the service manuals for their equipment. The most useful sections of the manual are the schematics and printed circuit diagrams. Good manuals will also describe the theory of operation and alignment procedures, and contain a complete parts list.

If your radio has too much hysteresis, and is not listed in the table, study the service manual. Motorola MC3357, MC3359, and MC3361 integrated circuits, which contain IF and squelch circuitry, are popular in scanners. In these receivers, look for the hysteresis resistor to be connected to these ICs.

Notes

1. The author cannot furnish modification information for other radios.

2. Don't attempt this, or any other internal modification, unless you are skilled in electronic servicing.

3. Make sure your receiver is disconnected from any power source before opening the cabinet.

4. If space permits, you can replace the stock resistor with a higher value variable resistor ("trimpot") and adjust to suit.

Table 1. Squelch Hysteresis Resistor In Selected Receivers

Squelch Hysteresis Resistor In Selected Receivers		
Receiver Model No.	Res-istor Value	Stock Comments
Radio Shack PRO-24	R35	33K replace with 220K. Located between pins 12 and 14

	of MC3357 (IC1)
Radio Shack PRO-2002	R197 47K try 220K.
Radio Shack PRO-2004	R148 47K remove R148
	or replace with 220K.
	On linear board,
	between pins 12 & 14
	of TK10420 (IC2)
Radio Shack PRO-2006	R152 33K try 100K or higher.
Radio Shack PRO-2022	R91 33K replace 33K
	with 220K.
	Between pins 12 & 14
	on IC-1 MC3361
Radio Shack PRO-2035	100K replace 100K
	with 220K.
	Between pins 12 & 14
	of TK10420 (IC-2)
Electra/Bearcat 220	R75 2.7M may be ok as is
Electra/Bearcat 20/20	R75 2.7M may be ok as is
Electra/Bearcat 250	R66 2.2M may be ok as is
Uniden/Bearcat 760XLT	R58 22K replace with 6.8K
	or other value.
	(select value for
	the particular radio.)
	Located on pin 14
	of MC3359P IC
Uniden/Bearcat 800XLT	R91 860K replace with 2.2M.
	Located on pin 14
	of MC3359P IC
Plectron P1	R81 180K may be ok as is
Plectron 700	R96 180K replace with 560K

REPAIR TIPS: RADIO SHACK SCANNER RADIOS

Copyright 1997 - 2001 by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner,

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.]

Introduction

Radio Shack has been selling scanners and monitor receivers
under the Realistic and Radio Shack labels for over 30
years. Most of them were manufactured by General Research
Electronics of Tokyo, though many newer models are
manufactured by Uniden.

The date of manufacture is usually printed on a gummed
label on the scanner as well as the cardboard box. A code
of 12A5, means the scanner was made in the 12th month of
1975, 1985, or 1995, for example.

There's another way to date Radio Shack scanners
manufactured by Uniden. The first digit of the long serial
number is usually the last digit of the year of
manufacture.

Another way to roughly estimate a radio's age is to examine
the 4 digit date codes often stamped on the integrated
circuits. The radio must have been made after the most
recent date stamp.

Schematics, Owner's Manuals, and Parts Available

I cannot furnish schematics, manuals or parts. Service manuals for most Radio Shack scanners sold through mid-1997 may be ordered through your local Radio Shack store.

If Radio Shack doesn't have a schematic, try obtaining a Photophacts from Howard Sams Publishing division of Prentice-Hall at (800)428-7267, http://www.samswebsite.com

Parts lists for recent and many older models are available on line at: http://support.tandy.com. Parts may be ordered through Tandy National Parts, telephone (800)241-8742, or through your local Radio Shack store. You may be able to obtain some technical assistance from Tandy by calling (800)843-7422, option 2. The RSU (Radio Shack Unlimited) phone number is (800)-433-2024.

G & G Communications (telephone (716)768-8151) is a family owned company which repairs scanners and stocks parts for several older models, especially Electra/Bearcat and Regency brands, but they don't sell manuals or schematics. They are located at 7825 Black Street Rd., LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

GRE-Built Base Models: Dim Backlight

The backlight in many base models, including the PRO-2022, PRO-2004, and PRO-2005/6 is implemented by an electroluminescent panel, which grows dim with use.

The EL panel used in the PRO-2005 and PRO-2006 is designated EL-501, and is identified by Radio Shack part #10800050. A new EL panel can be ordered through your Tandy National parts (see above) or local Radio Shack store and sent to your home. Radio Shack no longer sells replacement EL panels for the PRO-2004, but Robert Cummings has modified an LCD from a Miller Engineering (http://www.microstru.com) experimenter's kit and fitted it to his PRO-2004. See http://home.cfl.rr.com/scan/Backlight.html for details.

Replacing the backlight is an operation which requires care and patience. Purchase a service manual, and study the exploded parts diagrams as you read the following steps.

Top and bottom cabinet pieces must be removed, then the speaker unplugged from the main board. The front panel assembly must be removed from the chassis by removing 4 flat head screws, 2 on each side. You need not disconnect all the wiring harnesses, though you might have to unplug one so it won't get in the way of a hot soldering iron.

Unsolder the bare ground wire soldered to a large shield on the back of the front panel, located near the back of the

squelch control. Two ground braids must be temporarily disconnected by removing the screws which fasten them to the chassis. After removing the volume and squelch knobs, you must remove 8 small screws which fasten the plastic front panel to the diplay board.

The old EL panel is fastened by a bead of glue and two foil type leads soldered to the display board. It's easier to cut the two leads from the old EL panel before unsoldering. A sharp knife should be used cut away the glue. The old EL panel can then be slid gently out from behind the LCD display.

The new EL panel can be installed by reversing the process, though I found that it is not necessary to glue the new panel. The two foil leads must be soldered using a minimum of heat. Reassemble the pieces in reverse order of disassembly.

GRE-Built Portables: Worn Out Keypads

The keypad on late model GRE-made Radio Shack portables, e.g., PRO-39 and PRO-43, can become unreliable after prolonged use. The best repair is to replace the rubber keypad instead of trying to restore contacts using chemicals. A replacement rubber keypad (PRO-43 keypad is RSU#10789808) may be ordered inexpensively through Tandy National Parts or your local Radio Shack Store.

PRO-43: Loss of Audio

Early PRO-43s were built with a 200 mW speaker (mfr's part #EAS-3P123A). The voice coils in some of these speakers have opened, resulting in lack of audio output, though audio is still available from the earphone jack. A more capable 500 mW speaker is available through Tandy as replacement (EAS-3P127).

PRO-43: Freezup

If you attempt to lock out all 20 channels in a memory bank, then scan only that bank, your PRO-43 will freeze up and be placed into a catatonic state. Use the procedure documented in the PRO-43 user manual to fully reset the scanner. This will "break the trance," but all the memory channels will be cleared.

PRO-2004: Dead

If your PRO-2004 is completely dead, check R235, a 1 ohm, 1 watt resistor mounted vertically on the main board.

PRO-7A: Channels 1 - 4 or 5 - 8 Dead

If the first or last 4 channels in your 8 channel PRO-7A
crystal scanner are not working and the lamps for those
channels won't light, replace IC4 or IC5 (type 7400A).

SCANNER RADIO REVIEW BRIEFS

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. It is posted twice monthly on the USENET groups rec.radio.scanner, alt.radio.scanner, and rec.radio.info. It is also available electronically from the rec.radio.scanner ftp archive on the official USENET FAQ library ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.]

Abstract

This article contains product review summaries for more than 70 old and new scanner radios and monitor receivers.

The author writes a monthly "Scanner Equipment" column for Monitoring Times magazine, published by Grove Enterprises, but views expressed in this article are his own.

Introduction

At last count, there were over 140 scanners and monitor receivers of various brands in my collection. This article describes a few of the FM receivers in my collection, and other models I've tested. It is not meant to be complete.

You may share information with scanner collectors via the "vintagescanners" mailing list at:

http://www.onelist.com/group/vintagescanners

For more information about old scanners, see:

1. "Confessions of a Scanner Collector," by Bob Parnass, Monitoring Times, August 1988.

2. "Scanner Collector Primer," by Bob Parnass, Monitoring Times, May 1995.

I have published full length reviews and modifications of
these scanner models in Monitoring Times magazine:

Mar 1986 - Uniden/Bearcat BC800XLT
Mar 1987 - Radio Shack PRO-2004
Oct 1990 - Radio Shack PRO-2006
Jan 1995 - Radio Shack PRO-2035 vs. Radio Shack PRO-2006
Feb 1995 - Radio Shack PRO-62 Portable
Mar 1995 - Uniden/Bearcat BC9000XLT
Apr 1995 - Uniden/Bearcat BC3000XLT Portable
May 1995 - Uniden/Bearcat BC860XLT
Jun 1995 - Uniden/Bearcat BC890XLT & Radio Shack PRO-2036
Jul 1995 - Radio Shack PRO-2037
Aug 1995 - Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT
Sep 1995 - Radio Shack PRO-60 Portable
Oct 1995 - AOR AR-2700 Portable
Nov 1995 - selected AOR AR-8000 measurements
Dec 1995 - Radio Shack PRO-2040
Jan 1996 - Plectron & Motorola Alert Monitors

reprint fee.

ALINCO

DJ-X10T: 1998 vintage. Rugged construction - metal back.
Multimode frequency coverage 0.1 to 2000 MHz (minus cellular
bands). 20 selectable step sizes from 0.05 to 500 kHz.
Knob atop the radio clicks when rotated and serves as a VFO
knob, channel selector, and menu navigation control.
Several battery pack options for NiCd and alkaline battery
cases. Furnished with an EBP-37N 4.8 V, 700 mAH NiCd pack

and a sturdy 11 hour drop in charging stand. Loaded with firmware features and complicated to use. Two VFOs and 1200 channels in 30 banks of 40 channels each. Memory banks are cryptically designated, though you can scan combinations of banks. Each memory channel can be programmed with the frequency, an 8 character label, attenuator, a skip (lockout) flag, and mode (WFM, NFM, AM, USB, LSB, CW, AUTO). Very slow 6 ch/sec scan rate. Rescan delay is about 1 second and cannot be disabled or changed. Auto Memory Write stores up to 40 frequencies but does not check for dupes. 20 linkable search banks with labels. Up to 50 frequencies per search bank can be locked out. Digital clock with on/off timer. Battery saver can be disabled. Ability to scan or search for signals above a selectable threshold or channels with a specific mode. Band scope 7 or 40 steps wide. In short, 30 - 1000 MHz sensitivity is good, few birdies and little intermod. WFM broadcast reception very good. The DJ-X10T squelch can be set to one of 10 levels. We had to keep the squelch set to SQ3 or higher, otherwise it opens at inappropriate times, especially when the battery saver is active. The DJ-X10T instruction manual does not specify the IF (intermediate frequency) scheme. Filters inside the DJ-X10T imply 0.455, 10.7, and 45 MHz IFs. Our tests indicate a first IF of 736.25 or 275.45 MHz, depending on the frequency to which the DJ-X10T is tuned. Our DJ-X10T hears images of cellular phone signals clearly in the 1419.9 - 1444.9 MHz range, 550.9 MHz above their actual frequency. For a full review, including technical test results, see Monitoring Times, November 1998.

AOR

AR2700: 1995 vintage. 500 channel portable covering 500 kHz to 1300 MHz. Lots of good features, e.g., 10 linkable search banks, lighted keypad, per-channel attenuator, S-meter, battery meter, optional voice recorder and speech inversion descrambler. Global rescan and pause delays, but no auto store, data skip, nor battery saver. Internally generated noise results in broad birdies on AR2700 tested. Insensitive carrier operated (vs. noise operated) squelch stays closed on signals unless they are moderately strong, causing scanner to skip transmissions of interest. IFs are 287.55/749.25, 58.05, 10.7/0.455 MHz. See "The AOR AR-2700 Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, October and November 1995.

AR5000: 1996 vintage. approx. 30 kHz - 2600 MHz coverage super receiver. Good sensitivity throughout. AM, SSB, CW, FM detectors. Frequency readout to 1 Hz. More features than any other radio. DTMF reader and RS-232 interface included. Multiple settings for IF and AF selectivity,

attenuator, AGC, deemphasis, etc. DB9 RS232C connector. Negatives include low contrast LCD display and difficult user interface. NFM squelch closes slowly, causing noise burst at end of each NFM transmission. Electromechanical relays click at various frequency boundaries, including 400 MHz, producing a clickety-clack noise -- annoying while scanning banks of mixed band frequencies. Great radio, otherwise. See "AOR's AR5000 All-in-One Receiver," by Bob Parnass, in Monitoring Times, December 1996, for a review which includes quantitative test results.

AR8200: 1998 vintage. S/N 550004 tested. Portable, high end "super" scanner covers 0.1 - 2040 MHz (minus cellular in USA version). Not a scanner for beginners. Many of the settings are made through the use of menus. Lots of features. 4 AA batteries, steel belt clip, plug-in AM antenna. 1,000 conventional channels in 20 banks, 10 temporary channels, one priority channel. Each memory channel may be programmed with frequency, label, mode, step, step-adjust, offset, attenuator enable, noise limiter, AFC, and write protect. Multi bank scanning. You can enable a 0 - 9 second rescan delay with each scan group, but not per channel. 40 pairs of search limits with labels. Offset capability for monitoring repeater input frequency. LCD display easy to read. Display and keypad backlit using green LEDs. The band scope. Shortwave reception stone deaf on shortwave when fitted with the supplied antenna or a 19" whip. Seriously overloaded on shortwave by a 132 foot long dipole unless we use the built-in attenuator. Supplied "dorsal fin" antenna for AM BCB. Scans slowly (14 channels/s). Requires more current. Audio quality is slightly above other portable scanners. Computer port. One slot for a single plug-in option: voice inversion descrambler, CTCSS search, 256 frequency tone eliminator, voice recorder and playback, or extended (slow) memory. See AOR AR8200 review by Bob Parnass,in Monitoring Times, October 1998, for review with quantitative test results.

ICOM

IC-R10: late 1996 vintage (serial number 01048 tested). Shirt pocket size multimode is powered by 4 AA penlight cells. Covers 0.5 to 1300 MHz (minus cellular). NFM, WFM, USB, LSB, AM, and CW detectors included. IF bandwidths are fixed. No 30 kHz bandwidth for satellite or FM military monitoring. Battery saver circuit, with selectable duty cycle. Single VFO and 1000 memory channels. There are 900 memory channels divided into 18 banks of 50 channels each. Another bank of 100 channels used to hold unique frequencies found during an auto store operation. 20 pairs of search limits. Up to 100 frequencies may be locked out during a

search and stored in a final bank of 100 channels which is cleared before subsequent auto store searches. Each channel can be programmed with the detector mode (e.g., AM, USB), a tuning step size, an attenuator enable flag, and an 8 character label. CI-V computer interface requires extra cost hardware. 7 segment S-meter. Noise blanker. Good sensitivity. Lighted keypad and display, but keystroke sequences are cumbersome.

Good radio hardware in a handy sized package, but scanning performance unimpressive. Very slow memory scanning at only 6 channels/second. Searches at about 16 steps/second, with little or no worthwhile improvement using the "Signal Navigator" feature in the R10 I tested. Rescan delay cannot be disabled. Can only scan one memory bank or all banks, not a combination of banks. No squelch for SSB or CW modes. See "ICOM IC-R10 Receiver," by Bob Parnass, in Monitoring Times, March 1997, for review which includes quantitative test results.

R-7000: 1986 vintage. At about $1000, this was once the top VHF/UHF receiver. 99 channel, multi mode coverage from 25-2000 MHz with a small gap at 1000-1025 MHz. Memory can be expanded to 198 channels by adding simple switch to pin 19 of memory IC8. Tuning knob lets you tune through parts of the spectrum much easier than using the SEARCH mode on conventional scanners. Selectable USB/LSB allows reception of new amplitude compandored sideband (ACSB) stations. S-meter doubles as discriminator meter to aid tuning. Useful search and store feature, reminiscent of the the Bearcat 250, searches between 2 limits and automatically stores new frequencies into channels 80-99. Audio and control interface for tape recorder. Noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Searches and scans slowly but can be sped up to about 12 cps by adding a resistor. Too big for permanent mobile use, but too nice to leave alone in the car. If you don't want to spend $1000, get a Radio Shack PRO-2004/5/6 instead.

R-7100: 1992 vintage. At about $1300, this is the Cadillac of VHF/UHF receivers. 900 channel, multi mode continuous coverage from 25-2000 MHz. The radio RF/IF/AF portions of the R7100 are similar to the older R7000, but the R7100 is constructed using surface mount parts. Both the R7000 and R7100 are much more immune to intermod than the Uniden/Bearcat 760XLT and the portable PRO-43. The firmware in the R7100 is much more sophisticated. 9 banks of 100 channels. Further, you can associate each channel with 1 of 10 groups. Many possible ways to scan. 10 pairs of search limits. Search and store ("memory write") scan mode lets you store 100 frequencies instead of the 20 in R7000.

Another R7100 improvement is that you can program up to 100 channels for the R7100 to skip while searching. R7100 has 2 VFOs ("windows"). Both the R7000 and R7100 scan slowly compared with PRO-2004 and PRO-2006, and that's a drawback. Both the R7100 and R7000 employ a noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Scanning a mixture of VHF and UHF frequencies serenades the ICOM user with a very annoying clickety-clack, clickety-clack! For Baseband Audio out, I mounted an RCA jack on the back of the R7100A and connected it via shielded cable to the junction of resistors R228 and R230 on the Main Unit. This point is located in the vicinity of IC15 and X3 on the schematic.

R8500: 1996 vintage. 100 kHz - 2000 MHz coverage. 20 banks of 40 channels although bank sizes can be changed. 100 Auto store and 100 Skip memories but that can be increased by reallocating channels from the conventional scan banks. Fixed and programmable step sizes. Relays clickey-clack while scanning across band boundaries. Triple conversion, First IF is 48.8, 778.7, or 266.7 MHz, depending on band. Second and third IFs are 10.7 and 0.455 MHz. Weak to moderate cellular images starting near 1106 MHz. Rugged construction. External power supply. DB25 RS232C connector. Audio peak filter. Ok scanning and great searching performance. See "ICOM R8500 Receiver," by Bob Parnass, in Monitoring Times, January 1997, for a review which includes quantitative test results.

UNIDEN/BEARCAT AND ELECTRA/BEARCAT

Bearcat III (Electra): 1976 vintage. 8 channel crystal controlled scanner. Requires optional front-end circuit board for VHF-low, VHF-high, and UHF bands, but only 2 boards can be installed within the radio at the same time. Two crystal filters. No aircraft band coverage nor rescan delay. Front mount speaker sounds good. Strong local oscillator radiation often causes interference with other scanners in the same house.

Bearcat IV (Electra): 8 channel crystal controlled scanner. Newer version of Bearcat III but contains front-end circuitry for VHF-low, VHF-high, and UHF bands. Better selectivity than Bearcat III or 12 due to having three instead of two 10.8 MHz IF filters. No aircraft band coverage. Front mount speaker sounds good. No rescan delay.

Bearcat 5 (Electra): 1979 vintage. Eight channel economy base model covering VHF-low, VHF-high, and UHF bands. 117 VAC only. No track tuning. Black plastic cabinet.

Bearcat 6 (Electra): Six channel VHF-low and VHF-high bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 8 (Electra): Eight channel VHF-low, VHF-high, and UHF bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 12 (Electra): 1979 vintage. One of the last decent crystal controlled scanners. 10 channels. Variable scan speed up to 20 ch/sec. Single delay on/off switch. Front mount speaker sounds good. Manual contains schematic. Single conversion, 10.8 MHz IF. Selectivity is poorer than programmable models, like the 300, allowing adjacent channel interference. Covers VHF-low, VHF-high, and UHF bands but no aircraft band coverage. Crystal positions must be arranged by band.

Bearcat 15 (Electra): 1983 vintage. Actually made for Electra by competitor GRE (General Research Electronics). The only Bearcat crystal controlled base/mobile scanner offering 118 - 136 MHz AM aircraft band. 10 channels.

BC101 (Electra): 1975 vintage. First Bearcat synthesized unit. 16 channels, no priority. Frequency programmed in binary by setting toggle switches on front panel after looking up code in code book. No frequency readout. Uses custom IC for CPU, now discontinued, so factory authorized service is no longer available. I have four of these units. DC operation requires optional mobile power supply.

BC100 (Electra): First programmable portable scanner. Be prepared for at least one repair in the first year. Early units, with threaded antenna connector, have high frequency of repair, particularly LCD readout, keyboard, and battery holder. No battery backup. Poor case design in early units caused battery to disconnect from radio, resetting microprocessor and clearing memories. No priority channel or aircraft band. Some people swear by the BC100, others swear at them.

BC100XLT (Uniden): 1987 vintage. Very good 100 channel portable with 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Generous coverage of conventional bands, including commercial aircraft, but no 800 MHz. Decent leather-like case. Slide-on 550 mAH NiCd battery pack.

BC200XLT (Uniden): 1987 vintage. Also sold as BC205XLT through Scanner World. Very good 200 channel version of BC100XLT portable scanner but includes 800 MHz band. 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Decent leather-like case. Slide-on NiCd battery pack.

BC210 (Electra): 1977 vintage. First Bearcat scanner with a | keyboard and numeric display. LED readout. See US patents 4,092,594, granted 5/30/78 and 4,114,103, granted 9/12/78 for further insight.

BC220 (Electra): 1979 vintage. 20 channels. Reasonable number of features but 20 channels doesn't seem enough. Service Search for Marine and Aircraft. See US patent 4,270,217, granted May 26, 1981. LED readout. Good scanner, but tinny audio.

BC220XLT (Uniden): 1995 vintage. Very good 200 portable scanner which is a smaller successor to the BC200XLT. Includes 800 MHz band. 10 priority channels. Service Search, including WX. Up to 10 frequencies can be locked out during conventional search, 20 frequencies from Service Search. Unique feature tells whether a given frequency has already been memorized. 10.8 MHz and 450 kHz IFs, with images 21.6 MHz away. 4 cell BP-120 internal NiCd battery pack. Marketed as BC230XLT with two BP-120 battery packs and CRX-120 dual charger. See "The BC220XLT/BC230XLT Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, April 1996.

BC20/20 (Electra): 1981 vintage. Similar to BC220 but with 40 channels and different CPU circuitry. A maximum of 20 channels can be scanned at one time. Reasonable number of features. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC230XLT (Uniden): See BC220XLT.

BC235XLT TrunkTracker(Uniden): 1997 vintage. Portable with 300 channels in 10 banks. Can scan or search in conventional or trunked domains but not at the same time. Scans Motorola Type I, II, IIa 800 MHz trunked systems, but only one trunked system at a time. Programming Type I and IIa systems requires knowing the Fleet Map ahead of time or else using exhaustive trial and error. A query feature identifies duplicate memory channels. Very fast scan and search rates. Scans 64 channels/sec and skips empty channels. Service search. Data skip. Triple conversion, 254.4, 10.85, 0.45 MHz IFs. Excellent image rejection and intermod immunity. Fairly good audio. See "The Uniden Bearcat BC235XLT," by Bob Parnass, AJ9S, in Monitoring Times, July 1997 or an on-line version at http://www.grove-ent.com for a review which includes quantitative test results.

BC250 (Electra): 1976 vintage. 50 channel model, rich in features, but lacks aircraft band and 144-146 MHz. Search and Store feature extremely useful for finding federal frequencies. Clock. High frequency of repair. Power

transistors not heat sinked adequately, causing heat damage to surrounding components and circuit board. Failure of Q204 on the feature board known to cause odd display readings. Digital circuitry very sensitive to glitches caused by static and AC line spikes. Avoid 1978 or earlier vintage units. All BC250s use custom ICs (e.g., IC6, a divider chip, mfd. by Exar), which are now discontinued, so factory service is no longer available from Uniden.

BC260 (Electra): 1983 vintage. Super heavy duty metal cabinetry and lit controls, aimed at mobile use for firemen, police, etc. Few frills, only 16 channels, no aircraft, but generous coverage of federal bands omitted in the older Bearcat scanners. Good sensitivity. Lots of audio. Good internal construction. Backlit keyboard allows operation in the dark, but the keyboards on some units require high pressure to operate. Brightness control for display and keyboard, but multiplexor circuitry for vacuum fluorescent display produces audible whine which may be annoying in a quiet room. Backlighting may fail in some units due to poor contact on connector used to fasten light panel to front circuit board. 9 volt regulator transistor Q28 (TIP29) may fail, causing blank display while leaving audio intact. Method of connecting an external speaker is awkward.

BC300 (Electra): 1979 vintage. 50 channel top of the line scanner. Service Search feature contains 11 ROM banks of preprogrammed channels See US patent 4,270,217, granted May 26, 1981. Switching power supply failure noted in early units due to insufficient capacitance - component value was changed in newer units. Schematics show at least 100 components changed between earliest and later units. Preset squelch pot, mounted internally on circuit board, misadjusted in new units - adjustment usually required after burn-in period. Good sensitivity. Built in clock. I leave it on 24 hours a day. This is a favorite. See US patent 4,409,688, granted 11/11/83 for further insight.

BC350 (Electra): 1981 vintage. 50 channels in 5 banks. Includes aircraft. Used to be Bearcat's top of the line, overpriced scanner but never very popular. Dual use keyboard and display allowed 8 text characters to be associated with each channel, a feature clumsily implemented, and awkward to use. Units plagued with various hardware problems including bad memory ICs and short life power transformers. Firmware bugs without cures. The BC300 is a much better scanner than the BC350, and at a lower price.

BC760XLT (Uniden): Also sold as BC950XLT through Scanner World. Small, mobile scanner supplied with mounting bracket

and wall wart AC power supply. Some of the keys are backlit. 100 channels in 5 banks. Service search. Earlier version has Motorola type antenna jack and AA battery backup. Later version has BNC antenna jack and internal lithium battery. Can be fitted with optional CTCSS decoder. Hyper sensitive and easily overloaded by strong signals, especially when used with outdoor antenna in base applications. Conventional 10.8 MHz IF prone to images. Television audio heard in some places.

BC800XLT (Uniden): 1985 vintage. 40 channels in two banks. Covers 806-912 MHz, as well as of vhf, uhf, and aircraft bands. Receives 10 meter fm and all of 6 meters, as well as federal portions of vhf and uhf bands. Fewer birdies on vhf-lo band than other scanners. Scans and searches very fast. Clean, robust audio output. Extremely sensitive, but very prone to overload by strong signals when connected to outdoor antenna. Too much play (hysteresis) in squelch adjustment - can be improved by changing one resistor. Positive terminal in memory backup battery holder installed backwards in early units, allowing memory loss when scanner unplugged from AC outlet. Tunes in increments of 12.5 KHz on 800 MHz band, whereas cellular telephones are on 30 KHz channels. See "The Bearcat 800XLT ... an Owner's Report," by Bob Parnass, in Monitoring Times, March 1986.

BC860XLT (Uniden): 1995 vintage. 100 channel table top unit. Can lock out 10 channels during search. Good performer except for images. See "The Uniden Bearcat BC860XLT," by Bob Parnass, AJ9S, in Monitoring Times, May 1995.

BC890XLT (Uniden): Same as Radio Shack PRO-2036. Tuning knob. 200 channels, global delay. Count, AUX, and Auto Store features. Scans and searches fast. Accepts optional CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IF -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

BC895XLT TrunkTracker(Uniden): 1997 vintage. Base with 300 channels in 10 banks. Covers military air band, but other frequency coverage is limited compared with the BC9000XLT. Predetermined AM and NFM modes not selectable. Can scan or search in conventional or trunked domains but not at the same time. Scans Motorola Type I, II, IIa 800 MHz trunked systems, but only one trunked system at a time. Programming Type I and IIa systems requires knowing the Fleet Map ahead of time or else using exhaustive trial and error. Weather alert siren. Built-in CTCSS decoder and tone finder. A

query feature identifies duplicate memory channels. Test unit scans 85 channels/sec and skips empty channels. Triple conversion, 380.8 or 254.4, 10.85, and 0.45 MHz IFs. 800 MHz images in commercial and military air bands attenuated over 35 dB. For technical test results and a review, see "The Uniden Bearcat BC895XLT," by Bob Parnass, AJ9S, in Monitoring Times, December 1997.

BC9000XLT (Uniden): 1995 vintage. High quality base using up-conversion. 500 channels in twenty banks. Up to 250 channels can be programmed with alpha labels. Tuning knob. Selectable AM, NFM, WFM modes. Optional CTCSS decoder. Very fast scan and search. Can lock out 50 channels during search. Delay and attenuator independently programmable for each channel. Effective Auto Store feature stores unique frequencies. Good RF section, but not as robust as PRO-2004/5/6. IFs are 380.7/254.4, 58.075, 0.455 MHz. One urban user, located within a couple of blocks of several high power transmitters, reports severe desense problems. For a full review, see "The Uniden Bearcat BC9000XLT," by Bob Parnass, AJ9S, in Monitoring Times, March 1995. For tips and modification information, see my column in June 1996 Monitoring Times. See US patents 4,947,456, granted 8/7/90, 5,163,161, granted 11/10/92 and 5,212,817, granted 5/18/93 for further insights into fast scanning and searching implementation.

BC2500XLT (Uniden): 400 channel portable with tuning knob. Plagued by intermod and images. Early units drained batteries quickly even while turned off.

BC3000XLT (Uniden): 1995 vintage. Excellent 400 channel portable with 20 banks. Up conversion. Very fast scan, search, and intelligent Auto Store. Mode, attenuator, and delay settings programmable for each channel. 50 frequencies can be locked out during search. Larger speaker than PRO-26 produces better, crisper audio. NiCd pack provides about 5 hours between charges. See "The Uniden Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, April 1995 and "The Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, August 1995.

REGENCY

TMR series: First generation crystal scanners. Come in all varieties of band coverage. Models with both UHF and VHF bands must use separate antennas for each band (disadvantage in mobile installations, but can be overcome by connecting two front ends via a capacitor). Not sensitive enough to cover the entire 30 - 50 MHz range in a single model. There three versions of VHF-low band coverage depending on the

part of the 30 - 50 MHz band covered (LL, LM. and LH). TMR scanners use unsocketed incandescent bulbs for channel indicators which require periodic replacement. Easy to crystal: Radio Shack crystals work well. TMRs usually $2 and up at hamfests, often in poor condition. Don't pay more than $50, even if mint. Front ends must be tuned for selected portions within the bands for best sensitivity. Wide IF selectivity troublesome in urban/suburban areas. Primitive digital scanning circuitry may become confused at times. but power off/on restores sanity. Replace aging capacitors in the scanning circuits. You can find a TMR8H eight channel high band unit most often.

TME series: The base versions of the TMR models. Both the TME and TMR models share many common circuits but the base versions contain speakers mounted on the front panel. The most common TME model is the TME8 H/LM eight channel dual band scanner in a metal cabinet with wood coloring.

ACTR series: Replaced the Regency TMR units. By the time Regency made the ACTR units, they no longer offered different models for different parts of the 30 - 50 MHz band. Look for the later ACT series, e.g., ACTR-106 (10 channel tri band) or ACTR20/6 (20 channel tri band), used light emitting diodes for channel indicators instead of incandescent bulbs. Available in 1 to 20 channel models - most are multi band receivers. Somewhat wide selectivity. Not all that bad a deal if cheap.

ACTE series: The base versions of the ACTR series. The ACTE and ACTR circuitry is similar, although the base versions contain speakers mounted on the front panel. The most common ACTE model is the ACTE8 H/L eight channel dual band scanner in a black metal cabinet.

WHAMO-10: Regency's first synthesized scanner. Appearance more like a crystal scanner, with a single LED per channel. User has to break off teeth on a metal 'comb' for each channel according to a code book. See US patent 4,057,760, granted 11/8/77. External frequency control unit DFS-5K optional. UHF VCO reference oscillator drifts on some units. Soldered sheet metal shields around some circuitry make access to some components difficult for servicing. Comb sockets prone to bad connections after moderate use. Not recommended due to maintenance difficulties.

K500: Nice wood-like cabinet. 40 channel model with every feature Regency could dream of in one scanner, except aircraft band. Idle tone bypass feature for mobile phone stations works about 50% of the time. Weather alert feature. Service Search in several banks. Search and Store facility not implemented as well as BC250, but better than none.

Built in clock when radio off or in manual mode. Can be programmed out of band. Reasonable performance, but sensitivity could be better. Spring contacts on membrane keyboard may need soldering after prolonged use.

K100: Bare bones version of the K500. 10 channels, no priority feature. Same wood-like cabinet and reasonable performance as K500. Spring contacts on membrane keyboard may need soldering after prolonged use.

M400: 30 channel replacement for K500. Service Search, but no aircraft. Easily programmable out of band. Built in clock when radio off or in manual mode. Backlit keyboard good for night viewing and mobile use but generates RFI into nearby SW receivers. A favorite.

MX3000: 30 channel replacement for M400, but basic features only. Nice lit keyboard, but may cause RFI into nearby SW receivers. Easily programmable out of band, but no aircraft. All 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Good first scanner.

M100: 10 channel unit. Same as MX3000 except different color and fewer channels. Nicely lit keyboard, but may cause RFI into nearby SW receivers.

HX1000: Good, fairly rugged, 30 channel handheld synthesized unit. Generous out of band coverage but no AM aircraft coverage. Built by Azden. Very sensitive on UHF, but annoying audio hiss leaks through speaker when squelched. Belt clip chintzy, but can be directly replaced with better clip from Kenwood TR2600A. Like the MX3000, all 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Low discount price makes this best choice for programmable portable.

HX650/H604: 6 channel crystal portable. Likely made by Sanyo. Same as Fannon and Bearcat Thin Scan units, (except that Bearcat has 10.8 MHz IF frequency, and is harder to get crystals for), but scans faster. Small size and common crystals (available at Radio Shack), make this 1st choice for bare bones portable scanner.

Z60: base/mobile sporting 60 channels, but 10 of them are for FM broadcast only. Built in alarm clock, priority, and memory which requires no battery backup. Covers 30 - 50, 88 -108, 118-136, 144-174, 440-512 MHz. Notice that it's not spec'd to cover some important federal bands: 136 - 144 and 406 - 440.

RCA

RP-6150: 1997 vintage. No frills, good performing portable. 200 channels in 10 banks. No military aircraft frequency coverage. Triple conversion and a flexible battery arrangement. Lacks duplicate channel detection, search skip, and empty channel lockout features of newer designs. Our sample isn't super sensitive at 470 - 512 MHz and has some intermod around the VHF railroad channels but is generally more resistant to image problems than the BC230XLT. For technical test results and a review, see "The RCA RP-6150 Portable," by Bob Parnass, AJ9S, in Monitoring Times, April 1998.

RELM

HS200: 1996 vintage. Very good 200 channel portable. 10 banks. Built-in CTCSS and DCS decoder. Lighted keypad. Duplicate channel detection. 100 frequencies can be locked out from search. Very good audio and strong front end. Excellent internal shielding. Global rescan delay. Covers CB. Fixed modes and step sizes. IFs are 280.2 and 0.45 MHz, and perhaps one in between. See "The RELM HS-200 Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, April 1997, for a review which includes quantitative test results.

MS200: 1998 vintage. Made in USA. 200 channel mobile with alpha labels. CTCSS and DCS decoding squelch. Programmable via PC using supplied software. Low contrast, LCD display. Keypad backlit for night programming. Rear panel tape audio jack. Test unit had lots of intermod on VHF-high band. IFs are 280 and 0.45 MHz. See "The RELM MS-200 Scanner," by Bob Parnass, AJ9S, in Monitoring Times, March 1998, for a review which includes quantitative test results.

RADIO SHACK

PRO-24: 1983 vintage. Only 4 channels in this crystal controlled portable. Covers the three basic bands, but no aircraft. Easy to obtain batteries and crystals. Characteristic Radio Shack squelch problem, fixable by changing one resistor. All-plastic case larger than Bearcat Thin Scan and clones. See "The Radio Shack PRO-24 Scanner," by Bob Parnass, excerpted in the "Technical Topics" column, RCMA Newsletter, February 1984.

PRO-26: 1995 vintage. (Not to be confused with a simple 1985 crystal controlled portable bearing the same model number.) Very good portable made by for Radio Shack by Uniden. 200 channels, very fast scan/search. Good display. Covers all TV channels, but spectrum adjacent to cellular phone band is censored which prevents monitoring parts of some trunked systems (e.g., IL State Police district 4). Up to 50 frequencies can be skipped during search. Limited image

rejection causes 929 MHz paging interference in 170 MHz range. IFs are 380.7/254.4, 58.075, and 5.5/0.455 MHz. Audio suffers from small speaker. See "The Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, August 1995.

PRO-30: 16 channel programmable portable with aircraft band. Good frequency coverage. Extra controls on top allow control of SCAN, MANUAL, and PRIORITY functions while worn on belt. Good belt clip. Low audio output. Plastic case prone to break at BNC antenna connector under severe use, vs. metal frame in Regency HX1000. High price, no discounts or sales yet. I had 6 or 7 PRO30s, having to return them several times during the 1 year warranty, although other owners have had little or no trouble. Troubles included oscillation in IF stage, no UHF band reception, case broken around base of antenna connector, etc.

PRO-34: Portable scanner with 200 channels and 800 MHz coverage. Ten "monitor" channels. Operates from AA cells. Slow scanning, low audio output, and chintzy plastic case detract from an otherwise good performance. No decent leather case available from Radio Shack. If you need a portable with 800 MHz, get a Bearcat 200XLT. If you can't get a 200XLT, get a PRO-34.

PRO-43: Very good portable made by GRE. First Radio Shack portable with up conversion, and 222 MHz ham and 225 - 400 MHz military air band coverage. 200 channels, single search range. Small, convenient size. Muffled audio. Speakers in early units known to fail and more powerful speakers were used in later units. 800 MHz band coverage fully restorable in early units by removing diode. Uses same 6 cell battery tray as other high end GRE portables. Subject to interference in 160 - 162 MHz range. IF frequencies are specified at 608.005 - 611.2 MHz, 48.5 MHz, and 455 kHz.

PRO-52: 8 channel VHF-Lo/Hi base unit. No UHF band or provision for mobile operation. Good little scanner despite limited frequency coverage and Spartan lack of frills. Crisp squelch action and good audio, helped by a front mounted, vertical speaker.

PRO-60: 1995 vintage. Very good portable made by GRE. 200 channels, single search range. Similar features and same IFs as the PRO-43 it replaced but the PRO-60 has wider frequency coverage and crisper audio. Covers 75 MHz and commercial FM broadcast bands. Improved Direct search can be stepped manually in single steps. Uses same 6 cell battery tray as other high end GRE portables. Railfans take note -- the PRO-60 and PRO-43 are subject to interference in 160 - 162 MHz range. Draws 100 mA while scanning. See "The

Radio Shack PRO-60 Portable," by Bob Parnass, AJ9S, in Monitoring Times, September 1995.

PRO-62: 1994 vintage. Good portable 200 channel scanner using up conversion. Similar to PRO-43 but no military air band, different upper frequency limit, and slightly different IFs. Selectable AM/NFM modes. Better intermod immunity than PRO-43. See "The Radio Shack PRO-62," by Bob Parnass, AJ9S, in Monitoring Times, February 1995.

PRO-64: 1997 vintage. Good portable 400 channel scanner using up conversion. Replaces PRO-62 and has many more features. Selectable AM/NFM modes but fixed step sizes. 10 search banks which can be cascaded. Auto store saves unique frequencies found during a search. Frequencies can be loaded using a computer but optional interface kit not yet available. Can recharge Radio Shack's optional, monolithic NiCd pack, but not AA cells within the scanner. IFs are 257.5, 21.4, and 0.455 MHz. See "The Radio Shack PRO-64," by Bob Parnass, AJ9S, in Monitoring Times, August 1997, for a review which includes quantitative test results.

PRO-67: 1997 vintage. Good portable 200 channel scanner using up conversion. Replaces PRO-51 and has better image rejection and super fast scanning. Service Search lacks police frequencies. Fixed AM/NFM modes and step sizes. Can lock out up to 20 frequencies during a search. Can recharge AA cells within the scanner. Frequencies adjacent to the cellular phone bands censored so our PRO-67 will not receive 868.9625 or 823.9625 MHz. Intermediate Frequencies are 254.4, 10.85, and 0.45 MHz. See "The Radio Shack PRO-67," by Bob Parnass, AJ9S, in Monitoring Times, October 1997, for a review which includes quantitative test results.

PRO-91: 1998 vintage. Portable made by Uniden for Radio Shack. 150 channels in 5 banks. Can selectively follow conversations in 800 MHz Motorola trunked radio systems. Censors 823.975 - 823.95 and 894.0125 - 896.1 MHz covered by the BC235XLT. Powered by four individual AA alkaline or NiCd batteries. Power save feature. Program key. One priority channel/bank. One search bank. Direct search. Service search omits many police freqs (inc. 460 - 460.5 MHz). While connected to an outdoor antenna, our PRO-91 experiences intermodulation interference in the 161 MHz range from a paging transmitter on 158.1 MHz. IFs near 380.7, 10.85 and 0.450 MHz. See PRO-91 review by Bob Parnass, in Monitoring Times, December 1998, for review with quantitative test results.

PRO-2001: Early, single bank 16 channel programmable. Reasonable coverage of the 3 traditional bands, minus aircraft band. LED digital display as well as an LED per

channel. Mechanical lockout switch for each channel. Delay is either on or off for all channels at a time. High synthesizer noise level. Troublesome plated through holes on digital board in some units renders radio virtually unfixable. Could never get mine to work more than a few days in a row; always another bad connection. Some owners have no trouble.

PRO-2003: Radio Shack's 1986 top of line. 50 channels + 10 FM commercial broadcast band channels. Includes aircraft. Good frequency coverage and functionality, but at a high price. Poor human engineering: difficult to read keyboard makes the PRO-2003 hard to operate unless in a well lit room. Keyboard label coloring improved on newer units. Rather slow scan rate and high price. Although there are provisions for 12VDC operation, the cabinet shape and lack of mounting bracket makes mobile operation impractical. Scan rate only 8 channels/sec vs. 15/sec in Regency and Bearcat. Causes RFI: Plastic case permits scanner to radiate signals into nearby receivers.

PRO-2004: 1986 vintage. Top of the line, wide band scanner for 1987. After a diode is cut, enjoy continuous coverage from 25-520 and 760-1300 MHz, AM, NBFM, and WBFM. Has 300 channels in 10 banks of 30, backed up by conventional 9 volt alkaline battery. Any channel can be designated the priority channel. Scans and searches fast. Lots of well designed features, like 10 pairs of search limits, Lockout Review, default search increment and emission mode. Sound Squelch allows skipping dead carriers during search or scan. Metal cabinet, good internal construction and shielding, but no mobile mounting bracket or DC power cord. Soft touch membrane keyboard. Good sensitivity and selectivity. Very good radio. See "Product Review: The Radio Shack PRO-2004 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, February 1987, and Monitoring Times, March 1987.

PRO-2005: 1989 vintage. Essentially a size reduced PRO-2004 with surface mount components and 400 channels. Some people think the small knobs, smaller display, and plastic cabinet are a setback from the 2004. The smaller size, real rubber keyboard, and vertical front panel make it easer to use mobile, although the keyboard is not backlit. More sensitive than the PRO-2004 but 800 MHz signals leak through into the commercial aero band. Highly recommended. See "Product Review: The Radio Shack PRO-2005 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, June 1989, and RCMA Journal, August 1989.

PRO-2006: 1990 vintage. Essentially the same as PRO-2005 but scans faster. Probably the best scanner made to date.

Highly recommended. See "The Realistic PRO-2006," by Bob Parnass, AJ9S, in Monitoring Times, October 1990.

PRO-2021: Base/mobile scanner. 200 channels in 10 banks, LCD display and raised rubber keys. Lots of memory but scans too slowly and lacks 800 MHz. Ten "monitor" channels. Radio Shack seemed to have an overstock of 2021s as they were on sale for such a long time. Close out price dipped to about $200, which made it a nice scanner for beginners.

PRO-2022: Base/mobile scanner. Like the PRO-2021 but includes the 800 MHz band. Somewhat prone to intermod in the 460 MHz range. Cellular images throughout the 847.6 - 869 MHz range. See September 1996 Monitoring Times for modifications.

PRO-2035: 1995 vintage wide coverage base made by GRE. 1,000 channels, but cumbersome 100 channel bank size. Tuning knob. Broader IF selectivity than PRO-2006. Poor dynamic range. 10 linkable search banks. Dumb Auto Store feature stores the same frequencies over and over. Wastes time scanning empty channels. See "The Radio Shack PRO-2035 - How Does It Compare With the PRO-2006?," by Bob Parnass, AJ9S, in Monitoring Times, January 1995.

PRO-2036: Same as Uniden/Bearcat BC890XLT. Tuning knob. 200 channels, global delay. Scans and searches fast. Count, AUX, and Auto Store features. Accepts optional CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IFs -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

PRO-2037: 1994 vintage. Triple conversion all plastic base scanner made by GRE. Home version of the PRO-62 portable but with more intermod. 200 channels in 10 banks, one search bank, selectable AM and FM. Uses up conversion circuitry but inadequate front end filtering still allows images, though not as bad as in 10.7 or 10.8 MHz IF circuits. Crisp, respectable audio given the top mounted speaker. See "The Radio Shack PRO-2037," by Bob Parnass, in July 1995 Monitoring Times.

PRO-2040: late 1995 vintage 100 channel base made by Uniden. Fair performance, but minimal image rejection. Local oscillator harmonics account for spurious responses, e.g., reception of cellular telephone calls in the 460 MHz UHF-high band. Scans over 40 channels/sec. Can lock out up to 50 channels from search. "Soft" on/off power switching via keypad. See "The Radio Shack PRO-2040," by Bob Parnass, AJ9S, in Monitoring Times, December 1995.

PRO-2042: 1996 version of the wide coverage PRO-2035 base with improved firmware and amber display. Made by GRE. 1,000 channels, but cumbersome 100 channel bank size. Tuning knob. NFM selectivity is still a problem but improved over PRO-2035. 10 linkable search banks. Smart Auto Store feature stores the unique frequencies. Can lock out up to 200 frequencies from search. Query facility indicates if and in what channel a frequency is programmed. Scan skips over empty channels automatically. Can sort memories by frequency within a given bank. IFs are 609 - 612, 58.05, and 10.7/0.455 MHz. Broader IF selectivity than PRO-2006. Overall, a top grade scanner and second only to Uniden/Bearcat BC9000XLT. See "The Radio Shack PRO-2042," by Bob Parnass, AJ9S, in Monitoring Times, February 1996.

PRO-2045: 1996 vintage. Very good 200 channel base/mobile made for Radio Shack by Uniden. Tuning/channel selector knob. 10 banks, selectable attenuator, and rescan delay. CTCSS-capable with optional board. Great Auto Store. Weather alert. Scans and searches fast. Can lock out 50 frequencies during search. Step sizes fixed but AM and NFM modes are selectable. IFs are 380.7, 10.7, and 0.455 MHz. Images on VHF-high band despite high 1st IF. Some intermod on review unit. See "The Radio Shack PRO-2045," by Bob Parnass, AJ9S, in Monitoring Times, February 1997, for a review which includes quantitative test results.

PRO-2046: 1996 vintage 100 channel mobile made by Uniden with fairly good performance. Descendent of the BC760XLT but no CTCSS option available. Ten banks of ten channels. Scans memory at about 34 channels/sec. Service search, direct search, and band search. Preset search limits by band and user cannot program the search limits. Image rejection is minimal, as one would expect from a scanner with IFs of 10.85 and 0.450 MHz. 10 Monitor memory channels. Can lock out up to 20 channels from a search. See "The Radio Shack PRO-2046," by Bob Parnass, AJ9S, in Monitoring Times, October 1996, for a review which includes quantitative test results.

PRO-2050: 1998 vintage 300 channel Motorola trunk system tracking base made by Uniden. Tight front end. Excellent performance. Chassis-less, plastic construction. Squelch and volume knobs too close and Manual key is hard to find. IFs are 380.7 (approx.), 10.85, and 0.45 MHz. AM and NFM modes are factory set and not selectable. 300 channels in 10 banks and a 2 second rescan delay may be programmed on a per channel basis. Query feature identifies duplicate memory channels. Our PRO-2050 scans at 78 channels/sec., skipping over empty channels. 10 priority channels. Up to 50 frequencies may be locked out from limit search. A single pair of limits may be programmed for a limit search.

No Direct key or direct search facility. Factory preprogrammed frequencies for police, fire/emergency, commercial air, public service, and weather, but not marine. See May 1998 Monitoring Times for a review which includes quantitative test results.

SONY

SC1PC: 1998 vintage. Good RF and audio performance. Covers 25 - 1300 MHz, minus cellular phone. Selectable step size and mode. Computer control and downloading with software and PC cable provided. Powered by ordinary AA batteries. Provided CDROM includes both the scanner control program and the multi million record PerCon FCC license database. 10 banks ("pages" in SONY parlance) of 30 channels each. Per-channel 2 second rescan delay. Unlike the ICOM IC-R10, you can scan any combination of memory banks. You can lock out ("skip") memory channels from scanning. The frequency stored in a skipped channel will also be skipped during searches. One priority channel checked every 5 seconds. SONY's limit search is restricted to one pair of search limits, though computer control expands this to 20 linkable pairs. Band search lets you search through 17 bands programmed at the factory. Service search. A cache, termed Intelligent Memory, stores the last 10 unique frequencies that were active for longer than 5 seconds each. IFs (in MHz) are 600 (below 370 MHz), 232.5 (above 370 MHz), 45.0, and 0.455. For a service manual, call SONY at (800)488-7669, and press 3. See "The SONY SC1PC," by Bob Parnass, AJ9S, in Monitoring Times, August 1998, for a review which includes quantitative test results.

SPORTYS

JD-100: 1997 vintage. Limited 20 channel scanner which covers civil and military air bands only. Good audio. Large display shows frequency only out to 2 digits. Slow scanning and odd keystroke sequences. No key press confirmation beep. Cannot lock out channels from memory scan. Powered by AA batteries. Battery saver circuit. See "Sportys JD-100 Air Scan," by Bob Parnass, AJ9S, in Monitoring Times, November 1997.

CRAIG (division of PIONEER)

4530: Japanese 10 channel crystal controlled 3 band unit. Also available under Plectron name but in different cabinet. No aircraft band. Deluxe features like priority, trimmer capacitors for netting each channel, front panel speaker, and rugged metal cabinet make this unit a winner. Channel lockout slide switches have finite life. Replacing burned out incandescent channel lamps not fun. Grab a 4530 if you

find one in good condition.

SONAR

Sonar made several crystal controlled scanners and channelized monitor receivers which shared the same RF circuitry. Each radio was housed in the same size metal case and worked on both 120 VAC and 12 VDC. The models differed in the number of channels, the band coverage, and whether individual channels could be locked out.

Although they used a 10.7 MHz first IF, Sonar radios require parallel resonant crystals different from the common series resonant crystals used in Regency and Radio Shack scanners. Some Radio Shack crystals will work in Sonar units, but more often they oscillate a few kHz off frequency and are unsuitable unless changes are made to the oscillator circuitry. Therefore, beginners should avoid these radios. Typical Sonar squelch has long time constant causing a long noise burst at the end of each transmission.

FR-104, FR-105: 6 channel monitor receivers covering 25 - 50 MHz or 150 - 175 MHz. Manual channel selection, i.e., no scanning. Early models are identified by an 11 pin connector on the rear and they could be used with an optional NiCd battery pack and charger which bolted to the rear panel. Later models used Cinch Jones connectors with flat contacts. Optional tone decoder board.

FR-2512, FR-2513: 24 channel versions of the FR-104 and FR-105 monitor receivers. Manual channel selection, i.e., no scanning.

FR-2514, FR-2515: 8 channel scanners. Channel 1 priority. Recommend you avoid these models as there is no way to lockout a channel from the scan sequence.

FR-2526, FR-2526, FR-2528: 10 channel scanners covering various combinations of 3 bands. Each channel could be locked out. Channel 1 priority.

Sonar Model	#chan- nels	VHF low	VHF high	UHF scans?	lock- outs?
FR104	6	X			no
FR105	6	X			no
FR2512	24	X			no
FR2513	24	X			no
FR2514	8	X		yes	no
FR2515	8	X		yes	no
FR2516	10	X		yes	yes
FR2517	10	X		yes	yes
FR2525	10	X		yes	yes

FR2526 10 X X yes yes
FR2527 10 X X yes yes
FR2528 10 X X yes yes

Table 1. Summary of Sonar base/mobile monitor and scanner receivers

TENNELEC

Manufactured the first synthesized scanners. See US patents 3,961,261 and 3,962,644, granted 6/1/76 and 6/8/76 respectively. Company went out of business several years ago. Schematics and parts difficult to obtain. Radios reputed to be poor performers. Got my MS-2 and MCP-1 basket cases for free and sometimes regret taking them. Not worth fixing unless you have access to DTL/RTL chips and circuit diagrams.

Plectron and Motorola Alert Monitor Receivers

In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their transistor Plectron and Motorola Alert monitor receivers. They have now been replaced by portable pagers, and are often available at hamfests in the $5 - $25 range. Since many are in rough condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola Alert crystal controlled receivers are excellent for dedicated monitoring of local frequencies -- a task for which you wouldn't want to tie up your 400 channel programmable scanner. These radios are fixed channel units and do not scan. They can be powered form 117VAC or 12VDC with the proper mobile cord.

The audio quality on a Plectron P1 or 700 series is far better than any consumer grade scanner and the sensitivity and intermod immunity is outstanding if aligned properly. Better image rejection than most scanners (see article by Bob Parnass in Monitoring Times, January 1996 for comparison). The Plectron 500 series is less desirable. The Motorola Alert monitors are pretty good, although the audio lacks bass.

No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz band, and there were versions optimized for each portion of the band. There were different "split" models to cover segments of VHF-hi band, too. Although UHF versions were made, they are somewhat rare.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies

far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency. Too, the P1 and R700 require different crystals.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Repair service for the Plectron P1 and R700 models is offered by:

Woodson Electronics
Plectron Place
P.O. Box 960
Imboden, Arkansas 72434

telephone 1-(501)869-7985

Some replacement parts are currently available from Federal Signal in University Park, IL, phone (800)524-3021. For more information, see "Add a Crystal Receiver to Your Arsenal," by Bob Parnass, January 1996 Monitoring Times.

Custom Color Map & Report
of Transmitter Sites Near You

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country since 1994, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a beautiful 11" by 17" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc. See http://www.megsinet.com/~parnass for a sample.

RadioMap has been advertised monthly in Monitoring Times magazine since 1995. The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and

wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $10.00, the deluxe report includes and extra index sorted by frequency and a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $39.95 for deluxe RadioMap report with histogram and additional index by frequency. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

How to Obtain Copies of Patents

Printed copies of US patents may be purchased for $3 each, but you must know the patent number. Credit card orders are taken over the telephone by the Assistant Commissioner for Patents at (703)305-4350. Alternatively, you can mail a check or money order, made payable to "The Assistant Commissioner for Patents" to

The Assistant Commissioner for Patents
Washington, DC 20231

For more information about the US Patent and Trademark Office, call their automated information message system toll-free at (800)786-9199.

There are various patent servers on the world wide web, including Delphion's server:

: > in revenge for Waco. How many on the left did terrorism in revenge
: > for some act? Look at all the Red Brigades in Europe. Or the
: > Weathermen here in the US.
:
: You're roving pretty far afield there, buddy. Th Red Brigades do
: not operate in this country, and members of the Weathermen and
: similar groups are now either dead, in prison, or no longer politically
: active, so you're flogging a dead horse there. Remember, if you
: go blaming currently active liberals for those acts from past radicals,
: you open the door to all sorts of things, like legitimizing blacks
: blaming currently living whites for the actions of white slaveowners
: 150 years ago. Don't want to go there, now do you?

Actually we do have to settle up scores for blacks. While slavery
is not as much of the root cause of current problems within the black
community, Jim Crow laws are more to the basis of what is harming
and holding back blacks. And that is within my generation's
responsibilities.

How we help blacks make the full adjustment to mainstream society is a
big question. Affirmative Action seems to have ran its course. Something
better is needed, something that solves the early childhood problems within
the black community. It is hard to make up for the lack of early childhood
training and education with a quota system for adults.

We now have many, many successful blacks in our society. We recognize
the hard work that backed the genius of people like Louis Armstrong or
Michael Jackson (god, would he have made a great general). Blacks are
coming into leadership posts everywhere. Mixed marriages are common,
especially within the military. We need a final push to heal the divisions
that
many blacks feel.

So, yes, I do accept the burden of white racism, as many other conservatives
do. I also see that within the black community a great many who share my
views on social conservativism. The black community is more religious than

the white community. They have stronger families in many cases. Blacks believe in spanking, in strong discipline of children. In many cases they are
tougher on their kids than whites are.

And remember, John Ashcroft belongs to a church that was founded by a black man. And is the most racially unitified church in America. It is called the Assemblies of God.

Hello all,

I recently purchased a 2 Meter handheld transceiver and would like to try to purchase a mobile antenna that I could use in place of my cellular roof mount antenna which I no longer use. I'm looking for an antenna that I can screw right on to my existing cell antenna base, but I don't know what type of base it is. The base has a threaded stud that appears to be about 3/16" wide that the antenna screws on to.

What type of mount is this? And does anyone make a 2 Meter or 2 Meter dual band antenna that could be used on this mount?

Thanks in advance for any help.

Dave,
That stud is probably part of a black (or chrome) cap about 1 3/8" wide. I'm guessing if you unscrew that cap you will find the actual antenna mount below. If I'm correct in all this, that will be a NMO mount, and 2 meter antennas with NMO mounts are everywhere. Since it is on your roof, I'd guess that a 1/4 antenna would be your best bet. Motorola makes an antenna that will screw right on to the NMO mount with a whip that can be trimmed to the right length, check your local radio shop. As for makers of single/dual band antennas for NMO mounts, just about everybody who makes ham antennas has a line of mobile antennas for this mount. Comet makes some nice, if pricey, antennas for NMO.

BTW, you might try posting this to alt.ham-radio,vhf-uhf

Well, your "book" and what you "consider" don't happen to be the law of the land. Federal law says they are police and I know that a specific provision of the Texas Code also recognizes federal agents as LEOs as well. I'm sure the other states have similar provisions.

If you don't like the law, work to get it changed. But you as a citizen don't have the right to decide laws are invalid because they don't agree with your "book". If that were the case, anybody could nullify any law by saying "I don't consider x, y or z to be true or valid".

San Rafael Police are on an EF Johnson Multi-net system.

The Trunked frequencies are:

859.9625
860.9625

The Conventional frequencies are:

866.0125 Police Tac
864.0375 Police Command telephon

Ran Rafael Fire frequencies are available at the following URLs:

http://www.geocities.com/SiliconValley/Pines/2849/marin.html
http://www.geocities.com/CapeCanaveral/6298/marin/marin.html

Richmond is using EDACS system.

These are the frequencies ub LCN order

866.1000
866.7500
867.1000
867.6250
868.6125

Pinole and El Cerrito can be found on the Richmond EDACS system. The
City of Albany may be on this system also, but I'm not sure.

Pinole and El Cerrito are also simulcasting on their old conventional
frequencies which can be found at the following URLs:

http://www.geocities.com/SiliconValley/Pines/2849/cococo.html
http://www.geocities.com/CapeCanaveral/6298/contra/contra.html

The price is only $23.50 as of this message! This is gonna be a steal!

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1206595335

This auction is for a Regency Monitoradio/Scanner, model ACT-R 10 H/L/U.
Physical condition is a 9 out of a 10. This is a crystal controlled scanner
with 10 channels. It has red lights that flash from left to right to indicate
which channel is being scanned. There are two included antennas that screw into
the top of the scanner and there are two jacks for antennas - one for VHF and
one for UHF. The installed crystals work - they are frequencies used in my
area. I can't guarentee how many of the others work with this scanner.
Currently installed in the radio are the following crystals: 154.280, 155.100,
155.070, 155.610, 146.940, 146.580, 154.890, 460.425. Also included are:
155.790, 460.320, 158.250, 146.850, 146.250, 453.525, 156.090, 147.300,
146.550, 158.895, 146.070, 147.190, 153.995, 155.835, 154.995, 159.030,
453.925, 158.970, 122.700, 154.010.

I have had this scanner for several years and enjoyed it. My problem is that when the transmission is finished to start scanning again, it makes a loud squelch noise and then scans. It used to not do this. Can it be be fixed and how? It is very annoying when I listen when trying to go to sleep.

Any help will be appreciated..

No, you said he was ignoring the law......which law was he ignoring?

Come on, you can tell me, can't you?

> >You say he was ignoring the law, so exactly what law was he ignoring?
>
> He had illegally modified a shotgun, strongly suspecting it was a setup.

No, it was a setup. That was the ruling by the court on this.

> Then he failed to appear for a Court hearing, claiming he didn't get the
proper
> notification.

He didn't. That has been proven.

> He WAS notified that there was a warrant out on him, he could have
> simply appeared with the notice he DID sign, with the different appearance
date
> on it, and the problem would have been solved quickly and easily, and his
Wife
> and Son would still be alive.

Sorry, but no one is obligated to respond to non-offical rumors of legal
actions.

> But in THAT case, he wouldn't have been a martyr
> and hero to a warped group of people.

I see, so in your opinion, his failure to report to court because of RUMORS
there was a warrent issued for him, is justification for the government
agents to kill his wife in cold blood?

Don't you consider that response just a little extreme given the extent of his "offense".

> >How exactly does his ignoring the law justify the BATF to also ignoring the
> >law?
>
> I never said it did.
>
> BOTH sides were wrong. But few people on either side want to admit that.

Maybe, but I haven't seen where his actions have ever been shown to be in violation of any law. He was at least tried for those things which people claim he did wrong.

The government however, the issue, has NOT been charged or tried for their offenses.

> >> No, the Feds deliver their own warrants, and this was a contempt of Court
> >>case made worse by a bureaucratic screwup.
> >
> >"bureaucratic screwup"? I thought it was an illegal raid?
>
> Nope, the warrant service was legal, if it had been conducted within the guidelines
> set for it. The claim by the Government of possible resistance was so much crap.

Excessive use of force, is illegal.

> But you HAVE to win by beating the Government at it's own game, and getting
> someone in your family killed is NOT winning in any sense of the word.

So I should obtain a warrant on falsified information, then kill that person's family for being in the area?

Sorry, but no one is obligated to confirm with illegal actions being taken against them. Playing the game of "who can ignore the law the most" is a losing battle. Nor should someone have to sink to violating the law to protect themselves from this. However, they don't have to. His defense of himself WAS legal, just as the offense by the agents was ILLEGAL.

You misquoted me ... the quote in context is:

"First off, I don't consider the Feds "police" and if a Fed gets killed, it isn't a cop getting killed. A cop in my book exists only at the State level on down. Having said that, I don't condone killing Feds either."

Did you not read the last sentence?

I don't care what the Feds consider themselves ... cops or revenooers ... the point is that *I* don't consider them cops. Cops are on call to me 24/7 to protect my person and property ... the Feds are merely enforcement agents. But once again, just in case you missed that last sentence again, the fact that they are not cops doesn't mean that one should "kill" them, any more than one should "kill" a building inspector, of whose job the Feds are more analogous to than cops.

I am thinking about getting into scanning as a hobby, and have been looking for a handheld unit for a while. In my research I think I might get the AOR 8200 II (european version). Although the steep price I think it might be worth it. Anyone have this particular model and can give me some pro's and con's? I already read the review at strong signals. Also anyone know a way of decoding digital cell phone signals? I am not as interested as listening to people's conversations as I am how I can figure out how radio waves and cell phones and all that good stuff, and right now digital cell phones seem like a worthy challenge. Maybe running it into my computer through some program or something? Also is the earlier scanner I mentioned capable of trunk tracking? Any advice would be much more appreciated then links to a bunch of low quality web sites. Thanks.

1254. Robyn scanner owners manual

I just inherited an older ROBYN HIGH-LOW 8+8/16 crystal scanner.
I am in need of an owners manual or an instruction manual so that I can
figure out what the switches and lights do. Some of the bulbs are out
so I do not know what is going on.
I would be very happy with a photocopy of one of these manuals.
Thanks,
Chuck

1) Attempting to eat at a fast-food restaurant. You are likely to find them extremely short-staffed, since most black employees will take the day off. They will do this regardless of whether or not the employer has approved their absence. If a business owner should DARE object, he would immediately be branded as a "racist", "evil white slave driver", or worse.

2) Attempting to eat at a sit-down restaurant. While some black employees will not show up for work, others will. The ones who are working that day will spend the day harboring anger for whites. This hostility is likely to lead to actions judged undesirable to customers...like spitting in your food, for example. The great civil rights leader Jesse Jackson has admitted doing this and has encouraged his minions to follow his example. Just to get back at Whitey, of course.

3) Attempting to drive anywhere in the vicinity of a MLK Day parade. Your passage is likely to be blocked by the "festivities." If you dare object to the inconvenience, the black hordes are likely to turn on you with acts of violence. Contact Reginald Denny in Los Angeles for further clarification.

4) Running out of the following items, if you happen to own or operate a convenience store: 40-ounce bottles of malt liquor, Newport cigarettes, Magnum condoms, and deli take-out packages of fried chicken.

You will excuse me, your messages just got cross posted recently. I guess you were only cross posting to 10 or so conferences before.

Your basic assertions are incorrect, and to limit the amount of time I spend on nonsense, I was hoping you had a recent example that I may comment on. The only ones I noted seem to rather vague references. Let's see right wing:

Oklahoma bomber - nah offset by the unibomber

Eric Rudolph bombing abortion clinics - Nah offset by the many unborn saved, and the left continues extermination of the unborn that dare inconvenience a woman who has neither morals or responsibility. But then again she will be qualified for a genital herpes commercial on TV.

If we were to stick only with the abortion issue, the left makes Ghengis Kahn, Hitler,and several other luminaries look like school yard bullies. The left have killed more people in the name of freedom of choice that all the right wingers combined.

Your turn Sir!

How do you identify a NWO mount? I would suspect you're right because
your description of the cap was correct.

In the meantime, I purchased a stainless steel whip replacement from
RS, removed my cell antenna from the screw adapter and cut the whip to
about 20". I had to drill out the piece that held the old cellular
pigtail antenna because the replacement whip was a bit bigger in
diameter. I'm waiting to get an swr meter that I just purchased on
ebay to tune it down.

I think eventually I'd still rather get a better antenna, though.

Hello all, I'm a newbie at this scanning concept and need a little help. I'm thinking of buying a portable radio but am not sure about some of my options. I don't really want to spend much over 100 bucks if I can help it. I have a general thought about what kind of frequencies I want. Preferably something that can scan Citizens Band all the way to the 800 or 900's (So all of them, pretty much :-))

The one issue I can't find anything about are trunking systems? What are they exactly? I understand some of the police in my area (Northern Kentucky --right under Cincinnati OH) have gone to trunked systems. Is it a new idea that is the wave of the future? I'm concerned I will buy a radio and after five years, I won't be able to hear anything good. The same with digital, will major radio users switch to digital format in the near future, Or does nothing I say make any since at all :-p ?

I'm also wondering if new radios have anything over the old radios. I don't mind second hand, 10 years old equipment if it can do pretty much anything a newer (more expensive) can do. I noticed alot of radios on e-bay that didn't look too shabby.

Like I said, I'm green at this. Anything else you can tell me will certainly be read and appreciated. If anyone has any good website for a beginner, I'd like to look at those. Thanks for the info before hand.

Brand new, never used Optex home theatre headphone system

one pair of plush headphones
these are wireless and talk 2 AA batteries
the transmitter plugs into any audio device such as stereo and
scanner etc. great for walking around the house or sitting out
in the yard. the transmitter has a built in battery charger that
plugs in the headset (IF YOU HAVE 2 rechargeable batteries IN
THEM).

I will ship this free
for 28.00US (international postal check) or 30.00US cash
inside a nice letter.

thanks
brontebear1@home.com

Message-ID: <slogan-1401011837310001@rsvp-208-187-58-115.ac05.rcrd.eli.net>
Source record: 72073

A mint condition, full coverage, AR-8200 with box and documentation. This
unit has always been kept in the vinyl case and has no scratches or blemishes.
The only original item that is missing is the (so-called) antenna it came with,
apparently I misplaced it when I took it off the radio. Also included are the
following items: the optional CTCSS card, a hard to find SSE/Jim charging
stand,
a US type wall charger, and a vinyl carry case,. Price is $475 and
includes shipping,
buyer to pay by postal money order. Not interested in trades. Feel free to check
eBay for my references.

I think you're dead wrong with this post. MLK day is not Black vs.
White. It's a day to combat racism of all kinds. With a post like
this, I think we really, really need this day.

Points all taken. I think you're approaching this from a radio
professional's angle and I'm hitting from the Joe Hobbyist angle. The
lack of a ground connection on the LM kinda limits your dual-band
antenna options to be sure. I'm also a big fan of VHF 5/8 antennas that
are at DC ground potential, which can't be used on an LM system.

Federal code is not "the law of the land". In fact, little of
it is law at all. These are regulations that fall within the purview
of contract law such as effect FFLs and not non-participating
citizens. And these agents are not police. No federal agent has
carte blanche license to approach any state citizen. The BATF was
wrong at WACO and Ruby Ridge and a dozen other "raids" just in the
year 2000 alone.

You may like the idea of a pseudo-militaristic "snapto" authoritarian
state but I reckon there to be many out here that don't.

> If you don't like the law, work to get it changed. But you as a citizen don't
> have the right to decide laws are invalid because they don't agree with your

Well, I think you're exactly right, in speaking for yourself. You
"work to get it changed" and make sure you get it right because
as conditions worsen, those that support continued harassment,
vilification and attacks on the citizenry are going to be the ones
held to blame.

: If by "JW" you mean Jehovah's Witness, you've got the wrong black ex-star.

Michael Jackson the singer, is a JW. I wrote his name
when I meant Michael Jordon the basketball player.
Jordon is a skilled, highly disciplined individual who
would have made a great general.
```

Is there any reason to not want the enforcement of law?
Does not congress have the right to pass laws? Is it not
the president's job to enforce the laws that congress passes
just a mayor enforces the ordinances of the city?

And it is every citizens duty to enforce the law.

: > Well, your "book" and what you "consider" don't happen to be the law of the
: > land. Federal law says they are police and I know that a specific provision of
: > the Texas Code also recognizes federal agents as LEOs as well. I'm sure the
: > other states have similar provisions.
:
: Federal code is not "the law of the land". In fact, little of
: it is law at all. These are regulations that fall within the purview
: of contract law such as effect FFLs and not non-participating
: citizens. And these agents are not police. No federal agent has
: carte blanche license to approach any state citizen. The BATF was
: wrong at WACO and Ruby Ridge and a dozen other "raids" just in the
: year 2000 alone.

It is agreed that congress is not doing its job when it
gives over authority to make "law" to the agencies.
And we do not need 44 law enforcement agencies at
the federal level. Three would be enough (US Marshals
merged with the FBI as its CID, the Secret Service for
financial and tax laws, and the US military for borders out).

But then we only need five cabinet positions as well.

: You may like the idea of a pseudo-militaristic "snapto" authoritarian
: state but I reckon there to be many out here that don't.

That is far worst at the local level. Around here to be a cop you
have to have served as a Marine and have been a high school jock
(jocks enforce the "code" in high school).

: > If you don't like the law, work to get it changed. But you as a citizen don't
: > have the right to decide laws are invalid because they don't agree with your
: > "book". If that were the case, anybody could nullify any law by saying "I don't

: > consider x, y or z to be true or valid".
:
: Well, I think you're exactly right, in speaking for yourself. You
: "work to get it changed" and make sure you get it right because
: as conditions worsen, those that support continued harassment,
: vilification and attacks on the citizenry are going to be the ones
: held to blame.

What are you going to do as the Left used terrorism to destablize
the Bush administration?

:
: Whether this is true or not, all 50 states have "ratified" the federal provisions in
: their state codes, recognizing federal agents as LEOs. Unless you don't consider
: state laws to be real laws either...

And the US Marshals often deputize local sheriffs departments to serve Federal warrants.

Cops, including Sheriff's and city Marshals were originally know as peace officers ... and their obligation to the citizens was keeping the city/county and in some States, the State in a state of peace. Law enforcement was secondary to that principle.

If I had to call 911, I certainly hope that it is a cop that shows up, not some damned Fed enforcer.

It is not my duty to enforce unjust laws. I am not going to report my neighbor for smoking pot in his back yard because I feel that he has a right to feel secure in his home. On the other hand, if he is scaring the hell out of his wife and family with a shotgun, I want a cop who will take the damn gun from him and not worry about whether my neighbors right to feel secure in his home takes precedent over his wife right to not be killed.

A peace officer is well equipped to do just that. I reiterate. Feds aren't trained to keep the peace ... just enforce the law.

Ergo et sum. Feds aren't cops.

Yep ... and the FCC is a law enforcer ... and are not cops.
The FBI is a Law Enforcement bureaucracy, and perhaps an Federal investigative agency. But they aren't cops. They aren't driving down my alley at night, I don't call them when I am going on vacation, and in spite of some Congress critters desire to Federalize domestic violence (may God forbid!), a Federal agent is not going to be the one stopping the old man from beating the shit out of her ... it is going to be a cop.

The Federal enforcement agents are bureaucrats ... not police.

Our primary effort over the next two years in South Carolina will be to defeat Rep. Jim Clyburn in 2002. We feel his membership in the Congressional Black Caucus shows his intent to place the issues of African-Americans over those of the entire racial and political spectrum of voters in his district, and is therefore not consistent with the views and expectations of the people in this state.

We intend to inform the residents of South Carolina about the racist views of some members of the Congressional Black Caucus, which he fully supports with his continuing membership in that organization.

We also intend to make his voting record well know to the voters (something that is not well known now). We feel his support for various legislation has negatively affected even some of the Democrats who voted for him in past elections.

In addition to this, we are gearing up for the largest voter registration drive seen in this state in recent memory. Our intent is the double the number of registered Republican voters by the 2002 election. Moreover, our goal is educated voters who will show up at the polls on election day and vote with zeal.

We also intend to take a lesson from black leaders, and are in the process right now of organizing transportation to the voting booths on election day.

Question: how was CANADA named?

Answer: They put all the letters of the alphabet into a hat, and drew them out one at a time.

C eh N eh D eh

Unfortunately the royal stenographer was purely brittish and didn't know that "eh" wasn't A. It's just the lingo they use in those parts eh?

In any ase, nice to see that the igloos are holding up in the great white north. I went across the border yesterday dressed in my in my tuke and muck lucks to get some doughnuts and some real beer. Stopped in for some back bacon and saw a lead dog piss on my HMMV. I did manage to help out a stuck sled dog team. After I put some 2 cycle gas in the sleigh and pulled the cord then explained throttle and brake mechanisms the eskimo let the dogs off the harness attached to it. I had to refuse his offer of beaver pelts in exchange for the gas, but I shared my doughnuts and we told stories to each other over a few real beers.

Course eventually I did manage to trade the eskimo some ice for a container of real maple syrup.

I was better, but I got over it.

So you disagree smart boy? Can't get a new scanner with full coverage? You seem to be the only one saying such nonsense boy.

Regardless of whether you advocate their death or not, my point is, that what you personally "consider" isn't relevant. The law as it stands is determinative. By law (both federal and state), federal agents *are* LEOs.

Whether this is true or not, all 50 states have "ratified" the federal provisions in their state codes, recognizing federal agents as LEOs. Unless you don't consider state laws to be real laws either...

You have got to be kidding, right? Either that or you're a fool.
Racism against whites will not even be mentioned today (MLK day).
Instead, we'll have endless pictures of white police officers beating
blacks in Alabama (events from almost 50 years ago) and endless talk
shows with blacks talking about how horrible whites are.

In reality, today is just another day to trash whites with
hate-filled, politically correct, rhetoric (a prelude to the white
trashing orgy of February's Black History Month).

I actually *didn't* ask for examples of Federal cops, I merely gave one. I also haven't once used the term LEO 'til now. Hell, even BLM rangers write speeding tickets, investigate crimes and have a SWAT team. I have no quarrel with Federal Police policing their jurisdictions. I do quarrel with the Feds owning any land or property outside of DC, but that is a another matter from this one.

My point is that Feds are not policemen. They are government agents. Even health and building inspectors in my city are armed, have police "power", enforce the law and since they are chartered and sworn officers, they are considered LEO's and present themselves at conventions as such. They still aren't the police and neither are the Feds. I have never heard the FBI or ATF refer to themselves as police. They are agents and are in no way equal to a sheriff, deputy, policeman, patrolman, trooper or Texas Ranger. They are, OTH, bureaucrats.

And it is my belief that they shouldn't have been on the ground at Waco, that it was an illegal raid and that they got away with murder. I think that they DID fire first and I think that they got rid of the evidence. They didn't have a warrant in hand and had no intention of delivering one, and used a dynamic entry as opposed to a no-knock since the judge himself wouldn't issue one. And innocent adults and children died because of that arrogance. It was an illegal raid from start to finish. And they weren't, aren't and never will be police.

Aside from the name calling . . .

his first reply did say that cell capable scanners were illegal.

The only place that cell capable scanners cannot be bought . . . by the general public . . . is the US. That said, even US companies can and do make scanners that are cell capable for domestic and foreign sale.

OK, the NMO mount, after you unscrew the cap, will be a short mount about 5/16" high. The outside is generally a brass nut about 1 1/8" in dia. The center varies from one maker to another, but there will be a center contact button surrounded by a nylon insulator that comes up through the mounting hole, and the brass nut screws onto that from the outside. One part or the other usually has spanner wrench holes to hold or tighten the mount. If you have an AES catalog, got to the Larsen antennas and look at the pictures, they show a NMO mount on a trunk lip bracket.

Your whip will certainly work for now, and may be all you need, but if you don't have an overheard clearance problem, and especially if you get a dual band rig, a better antenna is a good idea. It's about hamfest season, so talk to other hams in your area and find out what they recommend. Then attend the next hamfest, there are always vendors there selling antennas. You can look over the different models and pick the one that suits you.

Good luck and 73,
Mark

Well- it all depends. Trunktracking is on the 895-not on the 2045. If trunktracking is not available in your area or if you are a beginner to the hobby I would say the 2045. The main things I see on a 2045 positive difference: smaller,much much lighter,direct search,easier to move around. The 895 has trunking,a little better at picking up weaker stations,signal strength meter, a little meatier audio,more channels if you have 300 frequencies to store and ctcss already there. Both scanners are good ones. I prefer the 2045 because I like to move scanners alot and I don't bother with trunking.

Well, gee... considering that the word "cop" is a slang term that won't be found in ANY code, including the state codes that give your local PD and sheriff's department their authority, that distinction is meaningless. Local beat "cops" and FBI special agents are both considered LEOs.

But since you want examples of federal "cops" other than the Capitol Police, how about the Park Police, the Uniformed Division of the Secret Service, the uniformed officers of the Federal Protective Service, the Park Rangers of the National Park Service... and I could go on.

All of these agencies enforce and investigate the same type of offenses that local PDs do. Just a few examples.

--The Park Police runs radar for speeders on the Baltimore/Wasington Parkway.

--Park Rangers enforce and investigate the whole gamut of offenses from dmoestic violence to disturbing the peace to murder in the National Parks.

--The Secret Service Uniformed Division handles crowd control around the White House.

Satisfied now?

I assume you have turned the squelch knob way over to the left to automatic? The 860 tends to have a little longer squelch tail. Maybe you just noticed it more for some reason.

Well, it sounds like you're just quibbling over semantics, then. Call them what you want but federal agents and police officers are both LEOs and they both enforce laws, albeit a different set of laws. They receive the same training as police and, with limited exception, have the same authority regarding the statutes they enforce. That doesn't change regardless of the label you use to refer to them.

I wish more people could get this right, it would eliminate all of the debate on the Second Amendment. In the early days, and by definition of those who wrote the Constitution, the militia consisted solely of the private body of citizens who may, at their decision, orgainze to take up arms in time of need. Any army or other body created by, or consisting of, government agents was NOT the militia.

I found the hit counter to be almost useless.
The waterfall scanner works a lot better imho.
It is easier to "visualize" data in a graph than to try and digest
8hours worth
of hits printed in a text file.

That is a pretty stupid point of view. Do you really want a police state in
this country, where the cops can invade your home, drag you away without
charging you with any crinme, murder you, etc ? Cops have guidlines to
follow, and when they choose to ignore those guidlines, and people`s rights,
then they have to take what they get. Up here in Maine, you don`t see them
invading people`s homes without just cause, and a warrant in hand, and them
in uniform, or they are likely to get their ass shot off, and the courts are
not going to do anything about it, just the same as any other sonofabithch
that wants to kick my front door in. What happened to "The people have the
right to be secure in their homes" in YOUR part of the country ?

People like you want to give the cops "carte blanche", anything goes. This
harks to the Republican view, that their property is "more important" than
freedom, people`s rights, or even people`s lives. Putting the almighty
dollar ahead of human life, in my humble opinion, is just plain wrong, and
is the epitomy of greed. But, of course, greed runs deep within the
true-blue Republican. When they get into office in Washington, it begins to
show, big-time, because you see, the tax money belongs to them, and their
rich pals, and anyone that is getting a check for anything from the
government, is "ripping them off".....

They stand up there and claim to love the Vets, while they strive to close the hospitals and bases that are supposed to take care of them, knock them off their benefits, etc,etc,etc, ad nauseum.

They scream about "freedom" while they try to take everyone else`s freedom away. It makes me sick to think that so many Social Security recipients, Vets, Blacks, women,and other hapless unthinking fools are taken in by their hypocrytical jive, and fail to recognize the enemy.

```
: > We need to defeat them now. Think about it,
: > 30 states voted in favor of GWB therefore
: > those states' senators have strong reasons
: > to support GWB's nominations. Email your
: > state's senators and let them know that
: > you support GWB's choices. The Left already
: > has it machine working (if anyone finds the
: > web page where they are coordinating that
: > attack, please post it).
:
:
: Our primary effort over the next two years in South Carolina will be
: to defeat Rep. Jim Clyburn in 2002. We feel his membership in the
: Congressional Black Caucus shows his intent to place the issues of
: African-Americans over those of the entire racial and political spectrum
: of voters in his district, and is therefore not consistent with the
: views and expectations of the people in this state.
:
: We intend to inform the residents of South Carolina about the racist
: views of some members of the Congressional Black Caucus, which he fully
: supports with his continuing membership in that organization.
:
: We also intend to make his voting record well know to the voters
: (something that is not well known now). We feel his support for various
: legislation has negatively affected even some of the Democrats who voted
: for him in past elections.
:
: In addition to this, we are gearing up for the largest voter
: registration drive seen in this state in recent memory. Our intent is
: the double the number of registered Republican voters by the 2002
: election. Moreover, our goal is educated voters who will show up at the
: polls on election day and vote with zeal.
:
: We also intend to take a lesson from black leaders, and are in the
: process right now of organizing transportation to the voting booths on
: election day.

One thing, though. Work with the black community. Help them
so that they no longer need the "black leadership". In many ways
the average American of Africian hertiage is very conservative on
social issues. They should be our allies instead of our oppositon.
```

1333. 2 Pro 2006's for sale, w/ Opto and CE 232 interfaces

: Cops, including Sheriff's and city Marshals were originally know as peace
: officers ... and their obligation to the citizens was keeping the
: city/county and in some States, the State in a state of peace. Law
: enforcement was secondary to that principle.
:
: If I had to call 911, I certainly hope that it is a cop that shows up, not
: some damned Fed enforcer.
:
: It is not my duty to enforce unjust laws. I am not going to report my
: neighbor for smoking pot in his back yard because I feel that he has a
right
: to feel secure in his home. On the other hand, if he is scaring the hell
out
: of his wife and family with a shotgun, I want a cop who will take the damn
: gun from him and not worry about whether my neighbors right to feel secure
: in his home takes precedent over his wife right to not be killed.
:
: A peace officer is well equipped to do just that. I reiterate. Feds
aren't
: trained to keep the peace ... just enforce the law.
:
: Ergo et sum. Feds aren't cops.

For one thing, why are you so dependent on the local police? Is it not
your job to enforce the law? In Germany they have far less police than
we do. Outside of the airports and train stations, you very seldom see
the police. They have a great network of old ladies who report everything.
Plus they have strong social values that restrict people's behavior via
family and friends (most people in Europe live and die within 25 miles
of where they were born).

It is your repsonsibility to set your neighbor straight. Confront them if
they are using drugs, even pot. It is not a healthy habit. Excessive
drinking is not wise either. Get involved in their lives. If they get
angry,
well that is why you own guns. But more problems need to be solved
at the family and neighbor level. We push too many things to courts
because we do not want to dirty our hands.

:
: Well, it sounds like you're just quibbling over semantics, then. Call them what
: you want but federal agents and police officers are both LEOs and they both
: enforce laws, albeit a different set of laws. They receive the same training as
: police and, with limited exception, have the same authority regarding the
: statutes they enforce. That doesn't change regardless of the label you use to
: refer to them.

What he seems to have a beef with is the enforcement of law verses
the policing (ie patrol and intervention). It is the old fight of the crown
vs the people. He wants a police force that acts like his big brother who
stops fights and keeps the neighborhoods quiet.

What he does not seem to understand is that it is not the business of
Law Enforcement to keep the peace. That is our job.

: them, but when it's blacks or poor people (as in Philadelphia's immolation
of
: the MOVE headquarters) then they're evil monsters that deserve to be shot
: > down like dogs. As far as I'm concerned, David Koresh was a cop killer,
: and so is Mumia Abu-Jamal. If you're for exonerating one, you've got to
be
: for exonerating both in my book. Otherwise you're just reserving the
right to
: > pick and choose which cops get killed -- and that makes you a cop-killer
: > supporter.
: >
: That is a pretty stupid point of view. Do you really want a police state
in
: this country, where the cops can invade your home, drag you away without
: charging you with any crinme, murder you, etc ? Cops have guidlines to
: follow, and when they choose to ignore those guidlines, and people`s
rights,
: then they have to take what they get. Up here in Maine, you don`t see them
: invading people`s homes without just cause, and a warrant in hand, and
them
: in uniform, or they are likely to get their ass shot off, and the courts
are
: not going to do anything about it, just the same as any other sonofabithch
: that wants to kick my front door in. What happened to "The people have the
: right to be secure in their homes" in YOUR part of the country ?
:
: People like you want to give the cops "carte blanche", anything goes. This
: harks to the Republican view, that their property is "more important" than
: freedom, people`s rights, or even people`s lives. Putting the almighty
: dollar ahead of human life, in my humble opinion, is just plain wrong, and
: is the epitomy of greed. But, of course, greed runs deep within the
: true-blue Republican. When they get into office in Washington, it begins
to
: show, big-time, because you see, the tax money belongs to them, and their
: rich pals, and anyone that is getting a check for anything from the
: government, is "ripping them off".....
:

: They stand up there and claim to love the Vets, while they strive to close
: the hospitals and bases that are supposed to take care of them, knock them
: off their benefits, etc,etc,etc, ad nauseum.
:
: They scream about "freedom" while they try to take everyone else`s freedom
: away. It makes me sick to think that so many Social Security recipients,
: Vets, Blacks, women,and other hapless unthinking fools are taken in by
their
: hypocrytical jive, and fail to recognize the enemy.

The Left has forgotten what it was like when the LEOs shot their way
into their homes in the '60s and '70s. Maybe they need a wake up call?

If you live in an area that has a Motorola Type I or II trunked system and want to get into trunk tracking the 895 is the way to go. The 895 also has excellent sensitivity and handles an external antenna well.

If your in an area where you need CTCSS tones, that feature is built into the 895, CTCSS tones requires a seperate board in the 2045.

If trunking and CTCSS tones are not a consideraiton and and space is the 2045 is smaller.

All things being equal I would buy a 895, prices of used models seems to be comparable and the 895 has more features than the 2045.

1339. Strongsignals.net

Message-ID: <93usfg$9q3$1@nnrp1.deja.com>
Source record: 72038

For everyone complaining about strongsignals.net I have the perfect solution -- don't visit there. Stay here and deal with all the off topic posting and back biting.

If you do choose to visit Strongsignals, be prepared to put up with some rules so that site doesn't mirror the junk that happens here.

And until you start to contribute to the web hosting bills and upkeep costs, I submit that your criticisms of conflicts and other such is entirely out-of-line.

If you feel that it is biased or unfair -- don't visit!

I tell you that I think people go there for a reason:

a) They think it is unbiased
b) They like that postings are "policed" to keep out garbage
c) It provides an excellent source of information

Regards,

Wayne

>in revenge for Waco.

I'm willing to see Waco as fairly neutral ideologically. The
Davidians, after all, were religious fundamentalists, the use of
military equipment enabled by the war on drugs, and what precipitated
the actual assault was a fear of child abuse.

> How many on the left did terrorism in revenge
>for some act? Look at all the Red Brigades in Europe. Or the
>Weathermen here in the US.

Well, as you point out, most of this took place in the 60s & 70s. In
the 80s & 90s (really since the killing of Alan Berg), most of the
violence has stemmed from the far right.

Just for the sake of argument, suppose I agree about this offsetting
you describe (I don't, but nevermind that for now). You're suggesting
a reciprocal relationship in these acts and that alone, by itself,
damages the basic contention--ie leftist violence in particular is to
be feared--that started this thread.

>If we were to stick only with the abortion issue, the left makes Ghengis

Abortion per se is not ideological. Abortions took place under any and
all circumstances. Access to legal abortion, on the other hand, is
ideological, sure. But driving abortion back underground isn't going
to save many, if any, lives.

I've been monitoring Hydro-Quebec (Quebec's Power Utility) for a few years on 142.6200 MHz but since last November, all I get on this frequency (and others in the 1xx MHz-range) is "Data" or non-voice transmissions. Recently, a truck came to work nearby and now, I'm afraid (and disapointed) that the company is using Clearnet's Mike System (Motorola iDen). That system being "scanner unfriendly".

Can anyone tell me if I'm right? Also, is there a Canadian newsgroup on scanners?

I want the local police to deal with the thugs. I am to old and beat up for that role. I see nothing wrong with a local constabulary keeping the peace, sending teens home late at night, watching my property when I am gone and giving grief to drivers tearing through the neighborhood at 50 per. I am not an anarchist, I am a small l libertarian and a Constitutionalist.

You are right, I don't want to dirty my hands and want to pay for professional muscle to do it.

So far your thinking has done nothing but make you look stupid. Just look at the next tripe you spewed.

> You see, I was talking about
> scanners made in the USA, you know, Radio Shack and Uniden.

Hey Einstein, Radio Shack has never made a scanner you see, you are wrong again.

Uniden does not make scanners in the USA but they do make cell capable scanners this very day you see, so you are wrong here also.

Try and get your facts straight would you? You see, facts and your thoughts are NOT the same.

Glenn

It has EVERYTHING to do with radio in general. Part 97.1(e) of the FCC rules describes one the principles of the amateur service -- "Continuation and extension of the amateur's unique ability to enhance international goodwill." Does this not apply to CB and scanning as well? Does it not start in our own backyard with extending a hand of friendship and understanding to those of other colors, creeds, cultures, languages, etc? Is MLK Day not a great way to emphasize what we as radio ops do? That makes this an EXCELLENT topic for discussion on this forum.

If you don't know if your area is trunking ask your local Radio Shack.
If I were you I would start out on a basic scanner. Get used to it then
move up. There are alot of scanners on the net you can buy for under a
$100 to get you going. I have both for sell a Bearcat 860xlt or a Pro
2037 for $75 for example.

Me wrote:

I'm looking to possibly purchase a full coverage scanner (minus
cellular
of course!) that receives the military air band (for airshows!). I
currently have a UBC-3000XLT that is a few years old. Is there anything
better on the market that is currently being manufactured? My price
point is $350 or below. In looking at various scanner retailer sites on
the web, I can see there are a small handful of models that meet my mil-
air requirement. Does anybody recommend either of the following or any
other models of handheld? The two I have come up with that are <$350
and have Military Air are Alinco DJ-X10T and Icom R10.

Any Suggestions?

I'm going to third that opinion. As a newbie to the world of scanners, Strongsignals is/was a GREAT resource for getting started, precicely because it was so orgaznized and policed. I like usenet a lot, and if you want unmoderated discussion and posting, it's the place to be. Sometimes, though, you need information and discussion that is fully informed. Strongsignals fufills a vital purpose.

: I want the local police to deal with the thugs. I am to old and beat up
for
: that role. I see nothing wrong with a local constabulary keeping the
peace,
: sending teens home late at night, watching my property when I am gone and
: giving grief to drivers tearing through the neighborhood at 50 per. I am
: not an anarchist, I am a small l libertarian and a Constitutionalist.
:
: You are right, I don't want to dirty my hands and want to pay for
: professional muscle to do it.

That is one reason that I would like the draft back. To force
people into taking up their responsibilities to defend themselves.

As it is, too many on the Left have ran from military service. There
are few liberals under the age 45 (ie since the end of Vietnam and
the draft) who have served. Yet they are the first to demand others
to go to foreign lands.

They also seem to think that they can bribe (raise the salaries of
the police and military so that we now have mercenaries instead
of a citizen force) others to protect them.

What they are getting is law enforcement and military who see
themselves as superior to the masses. After all if you kill a cop
it is an automatic death sentence. And we give cops guns and
badges so that they can tell you that they are more valuable, more
superior, than you.

And it does not stop at the police. Mayors have bodyguards,
governors have around the clock security, the president has
a small army. All to tell you that their lives are more valuable.
In other words guns are a status symbol.

: >woman who has neither morals or responsibility. But then again she will
be
: >qualified for a genital herpes commercial on TV.
:
: Just for the sake of argument, suppose I agree about this offsetting
: you describe (I don't, but nevermind that for now). You're suggesting
: a reciprocal relationship in these acts and that alone, by itself,
: damages the basic contention--ie leftist violence in particular is to
: be feared--that started this thread.
:
: >If we were to stick only with the abortion issue, the left makes Ghengis
: >Kahn, Hitler,and several other luminaries look like school yard bullies.
The
: >left have killed more people in the name of freedom of choice that all
the
: >right wingers combined.
:
: Abortion per se is not ideological. Abortions took place under any and
: all circumstances. Access to legal abortion, on the other hand, is
: ideological, sure. But driving abortion back underground isn't going
: to save many, if any, lives.

Nor will banning guns. Why is it that you understand that banning
abortion would cause back alley abortions yet you do not understand
that banning guns would create backyard gunsmiths. Already the
drug runners are smuggling full automatic AK-47s and even heavy
weapons into the US? They use the guns to protect the drug "mules"
then sell them to the gangs.

I'm _not_ a newbie to scanning and I FOURTH (?) that opinion. I've seen Rich build that site from just a few pages to what it is now, and believe me, it's obviously a labor of love for him.

Many, many times I have utilized his reviews or first impression write ups, and never have I been disappointed. Sure there's always going to be minor details that people don't agree with, but in my experience, his information is dead on. Heck, his review / write up of the MVT-9000 was ten times more useful than the radios own manual when working through the idosyncracies of that radio.

Much of state law is not law but cooperative enforcement of agency regulations. Probably all states have compromised their credibility and constitutions to some degree by encouraging foreign interference and this will be reflected in state elections. Nevertheless, each citizen must discriminate where possible and resist or ignore those legal pressures that are not right.

A recent example of private property theft found its way to the SCOTUS where it was ruled that the EPA can no longer declare wetlands and use other legal razzle dazzle in order to deprive owners of property.

Most state do have well-defined constitutions and statutes that are based on state constitutions. The trick is always into get the proper court in order to ensure constitutional guarantees.

This is the long range solution. In the short run, up close, intense, private and personal intimidation of bureaucrats is the best way to keep them in line.

Another category soon to hit the fan is that of "child protective
services" where the feds have promoted state bureaucrats to
steal children on the basis of some BS allegation.

> serve Federal warrants.

And they are wrong to do that, usually from ignorance but sometimes
because they like the power.

Federal marshalls operate openly in federal territories. Within a state,
they need the cooperation of a sheriff.

In some cases, a federal warrant can be served by the feds as
long as they are accompanied by the sheriff. In other cases
the feds don't have jurisdiction and either no law was broken
or it is state purview.

The federal government is given much more credence and power
than is warranted by fact or the law. This only serves to
reinforce their rootless agents to grab more personal power.
Those of you who are gung-ho supporters of absolute government
will eventually realize that without a balance of physical

power between the citizen and the government that no one
will be safe.

It is a semantic technicality, but an important one. Since
these regulations are usually not positive law, then the
agents are not "law enforcers". Secondly, most of the agency
regulators are not "officers" which refers to being an officer
of a court. Third, the notion of enforcement is not a
constitutionally authorized or protected status.

Of course that is why they are called "agents". Gee, it's even
on their ID cards.

Again, by defending the semantics you effectively support the
propaganda and are responsible for increasing the growing
trouble and misleading the citizenry. But then, if that is your
intention,...

Turn the scanner off, than turn it back on before welcome to the pro-92
goes away press the 3 key it should show version 1.00, 3.25 or 3.28.
Press scann to start scanning.

Here is the difference between the different versions.

1.00 is the first version. The problem with 1.00 is it had a hard time
following trunking systems.
3.25 is the same version that Uniden uses in There scanners.
3.28 Was made in China version 3.25 was made in Japan. They moved to
China to cut cost. It is the same as 3.25.

> regarding CB radios.

Well, someone doesn't *have* to enforce it, but assuming someone
does, then someone makes a charge. Then someone investigates. Then
someone finds the *perp*. Then someone makes an arrest. Then a
jury hears the case, and so on. There's much more to enforcement
than showing up with the hardware to be judge, jury and executioner.

Who is the chief law enforcement officer of the land? In the first place, there is no chief law enforcement officer of the land. You are probably trying to reach the AG of the federal government, not the president who is the chief executive officer. The AG jurisdiction is the territory and possessions of the federal government and by treaty and agreement with a state, certain specified constitutional laws that all states agree to.

Damn! You boys have been hanging out with Janet Reno too long. You really believe, or want to believe, that we have some sort of king or czar.

The militia was never "federal" anything. Militias always operate as a county/state unit.

Congress doesn't give local police any authority. There is no connection between the two. It is the state that gives authorization to receiving federal money and to cooperate with the feds.

Now get this straight. The Congress cannot pass a law that is not authorized by the constitution and it cannot pass law that directly effects you, unless the states agree to it.

These Titles and Acts that you find so alluring are federal regulations that effect people who contract (usually without their knowledge) with the feds.

This is as much a problem of letting the career military vote. You are so attracted to power that you'll do anything to be its slave.

If your PRO-43 died after you took it apart (sorry, haven't been following this thread), remove all the internal boards again and check that you aren't pinching one of the speaker wires. This will ground out the battery and will make the scanner appear dead. Very simple error, seen it a few times before. Not a big deal to fix but can be fun to troubleshoot. :-)

Good luck,

Robert

Sore/Looserman supporter..right?

Anyone been following the news, where the 10,000 Dade etc votes have
just been tallied? With the Left counting.. Bush still came out ahead.

Nya Nya Nya.! Bush won. Deal with it.

1398. Re: Anyone have a 780XLT yet?

Newsgroup: rec.radio.scanner
Date: 2001-01-16 06:28:05 UTC
From: RC <nospam@me.com>
Message-ID: <VRR86.37052$68.4711084@typhoon.tampabay.rr.com>
Source record: 71947

I own a PRO-90 (same as a BC235XLT), a 245, and just got
the BC780XLT. Very powerful scanner. Very sensitive and
the display rates a 10! For anyone who thinks there isn't enough
audio, I'd HIGHLY suggest getting a high quality external speaker.
I use a Bendix/King mobile speaker and it has enough volume to
breach the pain threshold while still being clear. In a mobile
situation, the stock speaker would likely be pointing at the floor,
which necessitates an external speaker anyway.

It does a wonderful job of following my local EDACS system
as well as all the conventional frequencies I've loaded so far.
I will soon purchase the Pozilla software so I can program the
rest via my computer. Loading the freqs and alpha tags manually
takes way too much effort.

The PRO-90/235 doesn't follow EDACS, so I only use it work.
The 245 is a great handheld and I use it while on the go. It has
now become my second choice of "goto" radio when I hear a
Police helicopter. The 780's alpha numeric display is awesome.
It is nice to finally know who I'm listening to without having to grab a
cheat sheet.

For an in-depth look at the radio, check out Rich's review:

http://www.strongsignals.net/htm/imp780.htm

Save yer pennies, this one's a must have!

And which cops did he kill? Oddly enough.. most of the dead ATF folks
died of wounds suffred at close range with armor piercing ammo.
Hurricane rounds IIRC. Guess who had full mags of said ammo in the
MP5s? Werent Koreshes folks

The excuse for what precipitated was the fear of child abuse. The facts of the matter were the ATF/Fbi needed a stalking horse and a grandstand play to gather greater funding. Period. You think it was purely coincidental that that media was called etc for the initial Waco assault, just when it was funding time again? If you do, I have a bridge to sell you.

Does any one know of a mod for the bearcat 120 xlt austrlain/new zealand version. I brought it as advertised that it would take 12.5 Khz steps in the vhf band - which it does not - it does it ok in uhf band. Does anyone know of a mod to fix this problem?

Thanks

Dale

See http://www.strongsignals.net/htm/pro-2067.htm for more info...

This scanner is about a month old.. I took it out of the box, listened to it for a couple of hours, and I just don't have the time to play with it... it's brand new and works perfectly. I also have AC Adapter for indoor use. Never installed in my vehicle.

Email privately if interested... I am in Austin TX.

RadioMax radio control software says it can provide voice announcements
of frequency, channel, etc, when a channel comes active. You need a PC
with a sound card and a scanner that can be controlled by computer.
I've never used it, but I have bought some other equipment from the
author, and it seems like a good program. URL is
http://www.futurescanning.com/ .

A quick true story. I worked for Sycor in Ann Arbor Mi. We were bought out by Northern Telecom, when they took over they declared the computer center off limits and posted their version of the SS to keep lesser mortals such as myself out of the place. One holiday weekend, I and another worker climbed through the ceiling and replaced all the enter keys with ones labeled "EH?"

Needless to say the new management took umbrage to it.

In spite of an intense investigation including "Ve have Vays uv making you talk", we were never found out.

Hmmm... the first one to webcast Montreal's airwaves... quite tempting!
lol

But I'm sure that someone has already done that. I'll have to check.

Having two scanners and a high-speed line is already a good start. I
will indeed think about it!

Any special software required?

The person leading this charge is a black conservative in Jim Clyburn's district. I'm just a low-ranking recruit.

But you shot your fat mouth again TW!!!(slapp,slapp) Can you go back to the part about radio shack and uniden making scanners in the US? Ya see TW...I would have ignored this glaring factual error from anybody else but you.
First we tell ya that you can buy scanner crystals at RS...you KNOW better and shoot you mouth off (Bang!).
Second ...we tell you the words "auction" and "sale" kinda mean the same thing...but you know better and continue to let us all know that that will not be tolerated...
now you are all hell bent on the cellular law bs that has been a continuous thread since I first logged on in '95...you were just a boy still.
I loved the one where you insist that Texes DPS didnot use 800mhz input channels for simplex operations...but if you listened to those channels near the governors Austin mansion in november you would have learned which units *did* use them.
And last but not least...like Glenn pointed out...you are not too proud of what you post...in fact you are kinda a "fraidy cat" with that x archive b.s.... you are afraid of spam cuz you keep changing headers...what else are you afraid of....the truth?

Don't go giving us all this "I'm a cop and honest and sworn to uphold the law bull" If I was living in Garland I would be scared shitless that you may be the one that finds a rape victim and arrest her for having a joint in her purse.
I have never said this to another law enforcement officer........so you are the first...

You are a disgrace to law enforcement and all that it stands for. Your judgement is impaired and you are a "bad shoot" just waiting to happen. The people of Garland Texas have been warned!

If you don't shoot some unarmed woman in the middle of the night...I'm sure you will rewarded with a great job in the department Professional Standard's Unit (Internal Affairs) where your fellow officers will gang rape you with your own PR-24.
.....and I though I was sick!!!!!!

Your Friend...

Yes...there is a special scanner that only the media is allowed to have because
they are special. The radios are also in U.S. newsrooms. Posession by anyone
other than sworn media is not allowed.. It is a federal felony under title 18usc
and can get you up to 10 years in federal prison.

People, I have been reading this thread and have one question: What the heck does all this crap have to do with scanners or and the subject line?

PS: I don't believe in cross posting, especially to groups that have nothing to do with the subject line.

What frequencies would one expect to scan at the inauguration? With "7" different law enforcement agencies in DC you best use a scanner that is capable of 200+ freqs..

Please, Have a Positive Day.

Hi there Tom..
Just curious, have you made any headway with your EMS talk id's ? I'm
having a bugger of a time too.

I assume you've been to
http://www.millwood.ednet.ns.ca/guidance/scan/scan.htm ..pretty good
site for N.S. but as far as I can make out the
trunking systems he discusses only include the control freq. etc for the
HRM Geizer's Hill and Barrington St. sites. These systems are pretty
much soley used by
HRM Fire now (which is primarilily why I wanted a trunker) but I sure
would like to get EMS cased out. Apparently HRM Police are pretty much
totally over to the provincial grid now as well.
I guess what we primarily need would be the control freq.(s) for EHS
and/or the provincial system (Don't know if it's different for Western
or Southern etc Dispatch)
Any idea if EHS uses the same type of hybrid system (requiring a fleet
map) or if they're Mot. Type II or whatever ?
I do have 20 odd freqs in the 859-867 range on which EHS can be
consistently heard but as you've observed without the trunking it's a
pain in the butt listening to snowplow operators when what you want to
hear is Rick and the gang ;) My Fire Dept. relied heavily on being able
to monitor EMS for ETA's etc and I'd like to be able to continue to do
so (Not to mention the RCMP but that's a whole other nasty encrypted
story)
Let me know if you find anything, I'll keep you posted at my end

Jim

To some, yes. But not all. I don't think, by comparison, that the right is nearly as monolithic on gun rights as people suppose. Didn't Reagan eventually come out in favor of the Brady Bill? And G HW Bush resign from the NRA after Gordon Liddy started advocating shooting "jack-booted stormtroopers" [ie, federal agents]?

1431. Antenna Help

Newsgroup: rec.radio.scanner
Date: 2001-01-16 14:42:20 UTC
From: Mark L Molnar <mmolnar@acsu.buffalo.edu>
Message-ID: <3A645DCC.871350B8@buffalo.edu>
Source record: 71978

Hi Everyone:

If this is covered in a FAQ somewhere, could I have the location?

Anyway, I live about three miles from a large airport and frequently listen to ATC and the like while working in my basement shop. I am using a simple Bearcat handheld scanner. Needless to say, reception is not the greatest in the basement.

My house is a two story with some fairly large attic space. The previous owner left a large TV antenna (ex. like something you would buy from Radio Shack) installed within the attic. Is it possible to hook the handheld's antenna lead to the attic antenna (via a cable from basement to attic) to improve reception? If possible, would I need to add any items in line (resistors, etc.)?

Would better reception be achieved just stringing a wire in the attic?

Any help would be appreciated. I have been thinking of getting more into the hobby and this would be a good start.

Thanks in advance.

Mark Molnar

I've noticed the same phenomenon with other combined air/public safety scanners. It is just the way the radio deals with the two different modulation methods, and the choices made by the designers of the receiver. If it makes you feel any better, lots of other radios have the same difference in volume.

wrote:

>Why do you need to listen to cell phones, anyway?

Assuming you really do have brains enough not to insult your readers
with a dumb question, here is your answer:

Listening to cell phones (which I used to do when it was legal) is a
good way to take the "social pulse" of an area. For example, you
might hear harried moms and dads making arrangements for picking up
kids in the afternoon. You might hear sales calls, you might hear
some chick talking to her latest boy toy.

It's not the details that matter, it's the numbers, the distribution,
and what kind of living people are trying to live...

It's also fun because, unless you really work at it, you can't tell
who you're listening to anyway.

Furthermore, if you were a journalist, and you were trying to figure
out what people were talking about after seeing a show or a movie, you
could park somewhere near by the movie theater and listen to the calls
various people made as they left the theater to gauge what they
thought of a film or play.

The potential is there. There are plenty of good reasons for
listening to cell phone calls without acting like a peeping tom.

Of course, if you're bent on doing rude things, you'll find other
ways. Scanners are tools. They can be used in all sorts of ways.
Why not convict the abuser instead of the tool?

How's that for a smart-ass answer to a dumb-ass question?

Source record: 71985

They are Richochet data system nodes. They lease space on street lights, pick up their power from the light-sensitive switch (generally located on the top of the "cobra head" part of the light) and receive/retransmit data packets from Ricochet subscribers in the area. A network of these things in an area is served by a high site (usually leased space on a existing cell site) where the packets are gathered together and connect to a T1 or are sent to another high site that does have T1 connectivity. You've already seen their ads on TV (although it's not really clear in those ads what the heck they're advertising - it's more like James Bond), but in a nutshell, it's a 28 KB packet service that they're tying to roll out nationwide. It's more widely available on the left coast (and most notably, the Bay area and Silicon Valley area) and at airports, although they are also building it out in the northeast corridor right now. They've been around in California with a slower version (I think 9600 or 14400) but they're upgrading all that to 28800. They are faster than CDPD, which is 19.2 KB at best, but it remains to be seen whether they will succeed in getting enough subscribers before someone with something "better, faster, cooler" comes along.

Until I corrected you, you were stating Radio Shack made scanners. Glad to see I taught you something.

>They are either Uniden or GRE.

That's not what you said a day ago boy. Glad I taught you something.

>I also know
> what Taiwan is and where it is.

Then why were you saying radios made in Taiwan were American made and unable to receive cellular? Nice to see you learned something here too.

Same reason you said Radio Shack doesn't sell crystals?
Same reason you tell everyone listening to cell and cordless is illegal when it only is in the USA?

>Get a life!

Compared to you I have 5 or 6.

Glenn

Remember, on the net nobody knows you really aren't a cop in Garland.

>The police are moving over to digital radio systems and it looks as though
>one will need a digital scanner to receive them. Does anyone know if there
>is such a scanner available yet

Indeed, often cited as one of the reasons for the switch (Privacy)

Digital Scanners seem a long way off in my opinion.

There was a post regarding News Orgs with radios for those communications; they are not exactly scanners but a receive only radio (yes under FCC regs I think it would qualify as a scanner) .

Sort of like SCA on the WBFM bands;
you have to be licensed just to get the receiver and it is "illegal" to tap into those communications as they are not intended for the general public.

Think the courts have ruled that the issue
with privacy and scanners is that the radios will not be made available to the general public and they are intended for "licensed listeners" only.

Think that it is possible to listen to digital signals and decode them but the cost/effort is a government or cartel level project; not for the random scanner.

Bush Sr. is an idiot on domestic affairs. This is typical of his
mis-reading of the American people....not understanding that the
phrase "jack-booted stormtroopers" is is a reference ONLY to
cops who routinely violate the law, particularly constitutional rights
of the citizens...the same rights which they took an oath to uphold
and protect.

For the coverage you want it may be difficult... look more around $150/200

>Preferably
>something that can scan Citizens Band all the way to the 800 or 900's

Possible...
http://www.radioshack.com/
http://www.strongsignals.net/

>(So
>all of them, pretty much :-))
>

Theres still more but not much...
Shortwave , LF, LW, MW, SSB...

>The one issue I can't find anything about are trunking systems? What are
>they exactly?

A radio system that manages traffic and such... works in the 800 MHz band,

see: http://www.trunktracker.com/

> I'm concerned I will buy a radio
>and after five years, I won't be able to hear anything good.

no worry, there is tons of stuff out there and the former police frequencies
may be licensed out to someone else to use...
there is the Ham bands, MURS, FRS, Business bands, military air/ground, ships,
and more that will stay on the 30-900 MHz for some time to come.

>The same with
>digital, will major radio users switch to digital format in the near future,

not a big issue and the non digital bands are still in demand and will continue
to be used for some time.

A good general coverage scanner will suit the initial needs you have; trunking
is an option but I am sure there is plenty of other stuff you may like to
listen to outside that area.

If you buy online just be sure of the seller and ask questions first; better to
pass up a great deal than to wish you had waited.

Look at rec.radio.swap newsgroup , on Ebay (check Profile of seller) at Pawn Shops or Ham Fests (alt.ham.radio)

(Please no direct emails to this address, all email will be forwarded to tosemail1@aol.com and or spam@aol.com. - I will read all replies here, thanks.)

No, I would not like it; but we're not talking about stalking here.

Would you like it if the sale of binoculars were limited to police officers? After all, they might be used by Peeping Toms. Would you like it if you couldn't purchase a quality zoom lens for your camera because someone might use it for surveillance?

The fact is this: There is no such thing as "Radio Privacy." It is a diseased figment of imagination perpetrated by some ignorant Congressional Legislators.

Radio is a public resource, no matter what laws we may make. If you don't want the world to hear what you have to say ENCODE, or better yet ENCRYPT. The technologies exist.

You have no more right to privacy on radio than you do while walking down the sidewalk. We can legislate that all sidewalks are private areas and that one should avert one's eyes to avoid seeing other pedestrians. But the reality is that they all exist.

Would you like it if someone told you that watching people on a public street was illegal from now on because the public has an assumption of privacy?

Yes there are. Bad law.
They do. Real law.
It is not.

> And it is every citizens duty to enforce the law.

Absolutely wrong. No citizen has any "duty" to enforce any law
and cannot be lawfully compelled as such.

A citizen may enforce any constitutional law and he may
refuse any unconstitutional law.

And a jury of citizens can nullify a law.

I hope you don't go about telling people that you are conservative.

Buddy, I couldn't have worded it any better. Not even if I gave it a few hours thought. You really stand firm on the ground and I salute you for it. Hell, they have video cameras taping you as you stroll down the streets in England. What if I want to pick my nose in private as I take a stroll down the street? What about those boom mics that can hear things up to 100 yards away. Are they illegal? No. Hell, spy satellites can see everything from space. And people wanna bitch about listening to airwaves that scanners were DESIGNED to pick up? If they are illegal, then disable a scanner from picking these frequencies up. Otherwise, do as you said and encrypt all of your phone conversations. Otherwise, we wanna hear what you have to say! LMAO!!!

Obtaining Crystals

If you do purchase a crystal controlled scanner or monitor receiver, you will probably want to buy more crystals to cover local frequencies.

Scanner crystals may be ordered from your local Radio Shack store or from one of the companies below. Be sure to specify the operating frequency you want and the brand and model of scanner.

Some companies may ask you to send a schematic of the scanner or require more detailed information, like series or parallel resonance, load capacitance, etc.

Electra Corporation stocks crystals for the Bearcat scanners:

Electra Corporation
11915 E. Washington St.
Cumberland, IN 46229
Phone 317-894-3229

Crystals for Bearcat and other models are available from:

American Crystal Co.
1623 Central Ave.
Kansas City, KS 66102
tel. 913-342-5493

Bomar Crystal Company
201 Blackford Ave.
Middlesex, NJ 08846
tel. 908-356-7787

Cal Crystal Lab Inc.
1142 N. Gilbert St.
Anaheim, CA 92801
tel. 714-991-1580

International Crystal Mfg Co.
11 N. Lee Ave
Oklahoma City, OK 73102
tel. 405-236-3741, 800-725-1426

G & G Communications
9247 Glenwood Drive

LeRoy, NY 14482.

Possibly the best handheld scanner for $200.00 would be the Uniden Bearcat BC245-XLT Trunktracker-II.

No, it is not true. None of the "new" scanners, legally sold to citizens in the U.S., receive cellular telephone frequencies.

1468. Antenna for 800mhz band

Newsgroup: rec.radio.scanner
Date: 2001-01-16 22:19:51 UTC
From: ujband@mail.op.net
Message-ID: <B68A7987yf@mail.op.net>
Source record: 71882

What are your thoughts and/or experience on using a cell phone antenna to pick up 800mhz freqs? I currently use the ant. that came with my 780XLT. Reception is better when the ant. is "not" extended. This has led me to believe a cell phone ant. located outside my house may improve my reception more than I experience now.
Thanks

Hi, Mario:

I've still got an old Bearcat 210XL here in the shack.

Nope, it won't scan between 176 and 420 Mhz.
However, you can sometimes hear frequencies 400 Mhz and up by entering
the frequency, plus the I.F. freq, which I think is 21.6. That way,
the signal will be heard at the first harmonic. So for example, let's
say you want to hear something on 411.00. Enter 432.6 and that should
do it.

If you sign up for our email newsgroup. You will find a great deal of helpful people to help you set up. There are a few ways to set up a scanner online. Live365.com seems to be the most popular. I have found the broadcaster at stationdirectory.com to be easier.

Join the egroup for livescanneraudio below. Lots of good info there.

Even better that you got a highspeed connection. You could leave it on all the time.

And I believe you would be the first scanner broadcaster from Montreal.

Interesting??

Take care..

Randy

I have a DDI decoder box with cables, DOS sw, and instructions for sale. It works great. I also have an AOR3000A which the DDI works with. A 2006 can be modified to work with the DDI if desired. Serious offers and questions will be answered. Place DDI in the subject line of your e-mail to me. Thanks,Ira

1477. Re: 364.200 mhz AM

Newsgroup: rec.radio.scanner
Date: 2001-01-17 02:17:52 UTC
From: Dennis <djmr26@bestweb.net>
Message-ID: <kh796.2807$8r2.333839@newshog.newsread.com>
Source record: 71876

A number of scanners pick up the 225-400 Mhz military airband. The PRO-2004/5/6
and PRO-2035/2042/2052 as well - the 2052 being a currently available model at
the RS stores. Several Uniden Bearcats as well. Also some handhelds. I know
there's a list on the net somewhere of which models pick it up; if I locate it, I'll
post the URL here.

Another portion of the spectrum where you find a lot of military air traffic is the
138-144 Mhz band IN AM MODE - here you must have a scanner capable of
switching mode - your 760, for example, has the mode for each band preset
and the 138-144 Mhz band is preset for FM - there is a lot of military stuff in
that band in FM, mostly ground use at bases for things like MP's and gate
security, and motor pool traffic, etc.

And lastly, you'll probably be able to hear quite a bit of mil-air in the 30-50 band,
AND IN FM, so you'll be able to hear it. Army & Natl Guard copters, Air Natl
Guard A-10 squadrons, etc. I'm in the Northeast, and I hear A10 traffic from
CT/ MA/ PA . Plus with an outside antenna, you should be able to pick up skip
from all over the place, lotsa military stuff. I catch Ft Hood in Texas most days
on 30.45 - listen for "Range Control" working various ranges; generally on the hour,
Range Control will give the weather on the range and the time. Depending on where
you are, you may or may not hear it, but they put out a hell of a signal
down there.

Sony sold 1 scanner - a handheld, the ICF-SC1 - which I bought on the net
several months ago VERY cheap - a good radio, but REALLY screwy to program,
and overloads with an external antenna, but it covers the 225-400 AND switches
mode. 300 channels. I enjoy it. Some started selling it at a good price, not happy
with the programming scheme, and it scans more slowly than other modern
scanners.

Check the "For Sale" board at the StrongSignals website -

http://www.strongsignals.net

and there are other boards scattered about the net, selling many scanners. Buyer beware, though, as many people scam you over the net - send the $ and never hear from the guy again. Hamfests are good for used scanners too. Good 'cause you can see them work right there. I picked up a PRO-91 for $85 in great
shape last year. Find the ARRL ham website (www.arrl.org?) and look for the list of hamfests in your area.

Richard

Actually almost any antenna outside your house will improve your reception compared to a stoch antenna inside. Almost any inexpensive antenna will make a world of diifference. I don't have any experience using cell antennas hooked to scanners. Again, almost anything close to 800mhz put outside will work better than your present inside arrangement. Make sure you use at least RG-6 coax or best for the buck and very low loss LMR-400. Losses will be high at 800 mhz.

Good luck.

Glenn

I believe that it was a democratic congressman from Michigan
who first called the ATF "jack-booted thugs" because of their
tactics. The ATF and DEA are considered to be rogue agencies
by the US Marshals, FBI and Secret Service. It has been said
that individuals who can't make it into the FBI or Secret Service
often get hired by the ATF or DEA. We had our court house
bombed a few years back. FBI and ATF investigated. The FBI
agents would not talk to nor even look at the ATF agents.

What needs to happen is to merge the 44 law enforcement agencies
at the federal level into three agencies. No law enforcement agency
should make policy and no agency that makes regulations should
have law enforcement power. The Secret Service should enforce
all tax, banking and security laws. Merge the LEOs of Customs,
IRS, ATF and Postal Inspectors in the Secret Service. Merge
the FBI into the US Marshals as the CID of the Marshals service.
Then merge Capital Police, GSA police, park rangers, DEA, INS
enforcement and such into the Marshals. Put Border Partol under
the Army and let DoD have enforcement of US laws, borders out.

You know what, you are right, but when they made the icoms and kenwoods, they weren't thinking about the blind, they made those radios for mobile use, for the sighted people so they wouldn't have to look down at the dial.

I don't think I would like that, because the computer would mess up what
you are trying to pick up, they would be too much noise.

I guess you guys have not tired it in a high RF City such as TORONTO ONTARIO (Canada for all you people who live in a shell)

It SUCKS on 800 The old 760 scanner does a better job

BEWARE!!

I've got two now and i use it for work 8 hours a day. Trust me, it sucks on 800 BIG TIME!

Other problems....

During scanning if you press manuel to stop on a talk group the stupid scanner switches modes for the key pad so if you continue to scan by pressing the scan button all of a sudden your no longer controlling the banks your editing the scan list.

You have to press the select button and switch back to BANK mode all the time.

Audio stinks, 800 sucks, 800 sucks, 800 sucks, 800 sucks.

Sorry no other way to put it. 800 SUCKS

a 760XLT works better. Heck maybe even the MR8100 !!!

Its a real shame, all this talk and wait only to get a radio that is useless in any large city.

Another problem is if you hold or press manuel to hold on a talkgroup and the scanner lost the control channel for second or whatever... it jumps back to scan and you have to find the bank you where on and go back to the talk group you where sitting on.

This is a major pain.

Thinking of buying this... HOLD OFF

wait for the next firmware or the portable version

800 SUCKS thats spelled S U C K S

I say again... the BC760XLT even works better.

NO its not me, its everyone I talked to that has one.

You install sirens and radios in the cars and you are a cop?

That's a new one on me. Methinks you are a garage mechanic.

But that is easy to find out. Lets have your badge number. That having
been said Mr by-the-law, you are now required to provide it. If you don't
have one, then you have publicly impersonated a police officer in this news
group, a criminal offence.

So give us the badge number or fess up.
If you fess up and shutup I agree not to forward your posts to the
appropriate authorities in your state.

If you give us a badge number, I will check it.

If you make any post to this newsgroup without your badge number, the whole
lot goes to your States Attorneys Office.

it is 1238 h EST Jan 17, 2001 you have 12 hours grace. Any post after that
will be subject to the terms stated above.

I do have a life . . . but everybody needs a hobby :))

It sounds like you mean an SPST pushbutton. This is the 'Mark 1'
version of this mod. If you use a DPST pushbutton you can get even
more functionality. One pole of the pushbutton is connected just
as you described. Connect one lead of the other pole to the
discriminator output of the Pro-94 (pin 9 of IC8). Connect the
remaining lead to the input of a 4.5 MHz SAW filter, and connect
the output of the SAW filter to the the base of UHF bandswitch
transistor (Q9) on the Pro-92. With this 'Mark 2' mod, you get
POCSAG and FLEX (tm) decoding, with output on the Pro-94's display,
after you press the button.

> I think that using a 9v battery on the Pro-92, and adding a
> Peltzier cooler to the processors might make them scan faster
> too, but I haven't confirmed this, so try at your own risk.

I heard that you could 'overclock' both scanners by replacing the
10.7 MHz crystal with a 21.4 MHz one to get double the scan speed,
but as you noted, they will probably give off more heat and require
more cooling. Some people say they have replaced that crystal
with a 107.0 MHz crystal to get ten times the scanning speed, but
then they have to immerse the scanners in liquid nitrogen, which
really wrecks the speaker cone.

> [Remember, modify at your own risk. This post is intended for
> entertainment purposes only. If you attempt any of the proceedures

The NiCad battery in my BC3000XLT doesn't appear to be charging
properly and will no longer hold a charge for very long. What can I
do about this short of replacing it ?

1509. Icom R-8500 Frontend

Newsgroup: rec.radio.scanner
Date: 2001-01-17 10:48:53 UTC
From: "Mark J. Bailey" <mjb@jobsoft.com>
Message-ID: <3a657aac@news.isdn.net>
Source record: 71708
Cross-posted to: rec.radio.scanner,rec.radio.shortwave

Hello,

Can any owners of the Icom R-8500 wideband receiver comment on how that radio's frontend filters and rejects spurious signals from strong local services such as AM/FM broadcasts and/or public service and paging companies????

I realize that many (most?) scanners have a "wide open" frontend that has the undesirable side-effect of paging signals in the air bands, etc., etc. As the R-8500 is a "communications receiver" with extended scanning capability, is it more likely to see little or no ("no" is what I am looking for) images and frontend overloading.

So, how does it compare to others in its class? Like the AOR 5000+3 (at $500 to $600 more) or the new Yaesu VR-5000 (at $500-$600 less)?

What I am looking for most in a receiver is to have signals where they should be and not have signals where they should not be! :-) Who could ask for anything more??? :-)

Thanks

Mark

NiCad battery do have a life span. Sounds like yours are near the end.
You can replace the battery pack, or you can open it and replace the
batteries inside of it. But there is nothing you can do short of some form
of replacing the NiCad's.

Interesting proposals, Greg. I agree with much of it (not sure about
putting Border Patrol under the army though).

> George
Hi George..
Just got one myself so I know what you mean.. just make sure you're in
trunking mode *before* you program your freq.'s in . There's only a
quick reference to this vital tip in the manual, it took me days to
figure it out. Hold down <trunk> for 2 secs. till it beeps, then choose
what bank you want to use. Select your trunk type (E2, whatever,
remember that E1 will need a fleet map), hit <e> and then input your
freqs. Hopefully one of them will be a control freq or you'll be SOL.
Hit search and away you go..

I used the the NiCad Lady to have my BC2500XLT battery pack rebuilt. Here
is the URL:

http://www.nicdlady.com/

From their home page, select "Radio Packs", then "U-Z" to locate
Uniden/Bearcat Scanners.

The price was reasonable and I am satisfied with their service. Good luck.

>LOL! I can tell most of you are too young to remember when there were
NO "private" landlines, either! Only the rich had private phone lines.
It was an expensive option. Most of us regular families had "party"
lines with as many as 8 families on it. Each family's phone had a dif-
ferent ring and, yes, your phone would ring, too, but you had to know
your "own" ring so as not to pick up on somebody else. To some people,
that didn't make any difference! Listening in to others' phone calls
was their whole existence. More than once, as a young teen, when ending
a call to a girl, I'd announce, "I HOPE YOU GOT IT ALL, MRS. ADAMS!!"
To which there would be a distinct 'CLICK" as she indignantly hung up.
Adding to that, there were always two old blue hairs that kept the line
tied up the live long day with gossip. Dad once had an emergency, and
politely asked the ladies to let him have the line. Once of them got
a little huffy with him, and already annoyed at his inability to use
the phone in the past, got in the car and went to a pay phone, made his
call and also made a complaint to the phone company which, in turn, cut
off their service for a couple weeks. Such "sharing" of phone service
often led to some innovative ways of getting the line away from the

gossips.

One Saturday night, another boy and I were at my house trying to get the line to talk to some girls. YAK YAK YAK YAK YAK! My buddy, Larry, who was something of a cutup anyway, after picking up for an hour, picked up the phone and yelled, "HEY LADY! YOUR BEANS ARE BURNING"! One of the women screamed, "OH MY GOODNESS"!! CLICK! Brrrrrrrrrrr! Listening on the extension, I doubled up with laughter! We got the line and kept it tied up for 2 hours just for spite.

"Privacy" is not a given even with landline phones. Of course, everybody has private lines now, but in the 1950s most of us took it for granted that we could be, and *were* listened in on. Cell phones are radios, after all, and the signals are sent hither and yon. Laws or not, some people are going to listen just like the nosey old biddies of yore. If you're going to use a cell phone, you should take that into account.

Jerry

People should have privacy.
but
> people talking on their phones don't. They expect privacy. And that is what
> they should have.

>
>That's what I thought. Like to dish it out, but can't take it. I'm not
>talking about stalking either.

I don't understand your argument. You were citing all sorts of examples where a person's privacy was invaded. And now you claim you weren't citing an example of stalking. I cite one example of activity in a public arena and then you say I "...dish it out, but can't take it." You're not making sense.

>> Would you like it if the sale of binoculars were limited to police
>> officers?
>
>I don't really care.

Maybe *you* wouldn't. But I know a lot of people who would. They use binoculars for star gazing, bird watching, surveying and so on...

>>Would you like it if you couldn't purchase a quality zoom lens for your
>camera
>> because someone might use it for surveillance?
>
>I don't care too much for high quality cameras.

But lots of other folks *do* care.

>> The fact is this: There is no such thing as "Radio Privacy." It is a
>> diseased figment of imagination perpetrated by some ignorant
>> Congressional Legislators.
>
>There is such a thing as privacy though. A cell or cordless phone should be
>treated just like a landline. People should have privacy.

Why? Because the user has a mistaken notion that somehow their cordless phone is a private connection? Does a person's ignorance mean they should still be protected? What about the rest of society that isn't ignorant? What about the public resources this person is using?

>> Would you like it if someone told you that watching people on a public
>> street was illegal from now on because the public has an assumption of
>> privacy?
>
>People walking down the sidewalk expect people to look and watch them but
>people talking on their phones don't. They expect privacy. And that is what
>they should have.

The fallacy of your argument is that you claim that by being in a
private area that your activities are somehow private. They're not.
For example, if you were in the habit of flashing people from your
bedroom window, someone would take notice and have you arrested for
indecent exposure. Likewise, just because you're attached to a
telephone land-line in some place doesn't imply that you can't be
exposed in a public place, namely, the radio spectrum.

Remember, the story of Lady Godiva is remarkable because she nearly
managed to do the very thing that you expect of society every day:
Maintain her privacy in a public place.

I think you're deluding yourself as badly as all those Congressional
Legislators who heard the siren song of CTIA PAC money. The only
thing I can't figure out is what's in it for you?

The Nicad bp2500 has a memory effect. After a time it has to be
completely discharged and then recharge for about 14 hours.
After time it will gone for good.
Go to http://scanshack.com/2500bat.htm, for the procedure to modify
to use aa or aaa batteries.

I cannot comment on actual use, but I have looked at the schematic. I
believe I counted 13 different bandpass filters up front. I don't know
how good the actual image rejection is, but is certainly isn't a wide
open front end.

Oh boy, I certainly don't want to get too involved in an argument as I'm new around here... BUT...

I think maybe you missed the point Glenn. I don't think it was aimed at people like you who *DO* appreciate the firemen/EMS -- I think it was a way to remind all the millions of people out there who do take them for granted that their jobs ARE important, and not all the "glory" or "excitement" you see on some of these shows on T.V. I don't think it was a literal wish to have people experience it, just a way to say that hey, maybe people SHOULD remember that the vast majority of these men and women are volunteering an invaluable service.

I'm glad you appreciate them Glenn. I sure do. But not everyone realizes or remembers that what they provide to the community is a lot more than riding around in a truck with loud sirens.

Take care,

Amy

From: sba3020@InfoNET.st-johns.nf.ca
Message-ID: <9456fefi1@coranto.ucs.mun.ca>
Source record: 71735

I heard that the ICOM PCR1000 receiver stored calibration values
in an eeprom and that some software or a bad command could erase
the values making the radio not work or work poorly. Also each
radio had a different value. I also heard you had to send the
radio back to ICOM and pay $$$ to fix it.

Is the ICOM R10 made the same way and can this also happen?

Is there a program that I can get from the net that will
recalibrate the radio to factory specs?

Is it commen for this to happen?

How does the R10 compare to the PCR1000 if they use the same antenna
in both HF and VHF/UHF? The specs look close and the R10 almost looks
like a handheld PCR1000 (on paper) and can be used via interface
to control the Radio just like the PCR1000.

I have a hand held PRO-94 with the standard rubber "duckie" antenna.

It works ok, but I am wondering what much better or more improved would it be with a discone antenna placed up un the attic.

Would I be able to receive signals 50% farther?? 100% farther??

just a basic estimation is fine, I know it depends on lots of things.

Lots of folks have gone to prison on murder convictions because the cops accidentally killed someone while responding to the original felony call. Any death that occurs during the commission of a felony (and Koresh was certainly committing a felony) is automatically first-degree murder.

Excellent post. I agree with you 100 percent. I have been playing
the "devil's advocate" in a number of my posts, to find out just how
far the nouveau right-wingers will go in supporting white, religious
cop-killers while damning black, leftist cop-killers as "monsters" (a
term which has been applied repeatedly to Mumia Abu-Jamal). Their
doubler standard is a sight to behold.

SInce you've already posted an article in which you identify your
group by saying "we ARE the police and the military ...", may I
assume you are offering here to shoot your way into our houses?

Of course we remember the 60's and 70's. We remember incidents
like the assault on MOVE headquarters in Philadelphia. We just
wonder why you support white, religious, right-wing cop-killers while
damning non-white, left-wing cop-killers.

A discone antenna has 0 gain. However, they are usually a wide-band design, more so than the duck, so you should see better, more uniform performance across the bands. Added to that, the additional height will help more than anything...especially for more distant signals. You want to keep your cable as short as possible, using a high quality coax. Antenna feed line has loss, especially in the 800MHz+ frequencies.

Try taking your scanner up in the attic for awhile, and see if there is a difference as far as height is concerned.

Source record: 71753

Almost anything will be better than the rubber duck.

If you have a TV antenna, try using that. Cheap, simple.
Mine worked pretty well.

I now use a discone on the roof and it works well for me.

In article <3a6645af@news.ismi.net>, nospam@ismi.net says...
> I have a hand held PRO-94 with the standard rubber "duckie" antenna.
>

You may want to take a look at some of the antenna reviews over at www.strongsignals.net. There was a good review of hand held antennas a while back that showed some real differences between the stock rubber duck antennas on a lot of models compared with extendable whip type and higher end rubber duck types.

As for discones, I placed a Diamond J-130 in my attic a while back and connected it to my Pro-2005 desktop replacing the stock whip that came with the rig. I only needed around 25' of coax and selected some RG-6 from Grove. My Pro-2005 really came to life. Most noticable was that I could now hear EMS units where I previously could only hear the dispatchers. This was great considering the antenna is no higher than the rig. The attic in which I installed the antenna is actually at the same height as my second floor office where the radio is.

> Is it true you can hear cell phones on some of the new scanners?

It's very possible that you could hear cell phones on image freqs -
around 21.4 MHz above or below the actual frequency - on some less
selective, dual conversion receivers.

Or you could head to a garage sale and pick up an old TV with an analog
tuner (you know, the ones with the two big dials on the front) and check
around UHF channel 83 or so. Much cheaper solution!

The only problem with cell phone monitoring from a technical perspective
(ie, not mentioning that it is illegal) is that newer phones are digital
and cannot be monitored with your average radio receiver. Or your above
average receiver for that matter.

I had the MR8100 boy it was bad....

I can't understand it. Why no one else has the problem but a few of us
here in Toronto Ontario.

I'm sure there are other areas that are worse with RF.

I use scanners as part of my job and have had all sorts of scanners in
the past. This one, no question about it, stinks. Cell sites are
wiping it out left right and centre.

Its ok until you go mobile with it. Fixed locations such as work or
home are often away from the cell sites but mobile its like night and
day.

Often not usable.

Honestly, I'd sware a 760 has a better front end then the 780!

Having identified yourself as a police officer, you are required by law to give your badge number when requested. That you don't know that speaks volumes. Since I respect all persons who are police officers, and your obvious lack of knowledge concerning basic procedure leads me to doubt you are one, I will forward your information to your States attorneys office, under the circumstances this is likely to cause you trouble whether you are or are not a police officer.

Sworn media? What in the world is that?

Any digital system can allow anyone to monitor them, by programming
a radio for them. They do not need to be media.

I heard on a local radio station this morning a promo for a sports talk show, and the topic was going to be about how one team got an unfair advantage by listening in to another team's radio signals. The stupid host had to overdo it by stating that "somehow they hacked into the other team's radio signals." In other words, instead of discribing the incident as a simple matter of listening to a radio signal, he had to hype it up as being something overly complicated.

Don't you just love how the media love to overuse words like "hacker?" It has such a menacing connotation.

Not to get into the middle of this mess, but exactly what law would that be?
And does it vary from state to state?

Officers should, when in the course of their duties, give their badge number
and name when requested, but I don't believe there is any law which requires
an officer to give this info. However, I could be mistaken.

Being off duty, however, is a different matter.

Before you go too far in this little stalking of yours, would you mind identifying this alleged law that requires a police officer to give you personal information when he/she is not on duty or acting under color of law? Just being a law enforcement officer doesn't mean that you give up your right to privacy off the job.

Also, for my benefit, tell me what a law enforcement officer should do to abide by this law when they work for a department, such as a local sheriff's department, that doesn't issue "badge numbers?" I've worked for a few and never had a "badge number." I've also had the privilege of being stalked by a couple of USENUTS and I didn't like it anymore than you probably would if someone did it to you.

Do you harass people often or just occasionally? Does it fulfill some deep emotional need? Does your employer know as much about your pastime as you are so eager to divulge to his? This is a scanner ng. Why don't you lighten up a little? Huh?

Law? Nah. There is no law that requires such in most of the US.

Individual departments may have RULES requiring such, but there
is no state/federal law that requires giving out your badge number
upon request.

Yes, go get one. I had my 780 up and running within 10 minutes after
I took it out of the box. It is a GREAT piece of equipment. Go get
one today!!

Ii¿½m looking for "Code3 Gold Plus" interface schematic, or for some
internet site where I can find it.
I think its name is "Hoka IF5 interface".

Thanx from sunny Spain.

Both of these radios show up on eBay from time to time. In fact, I recently purchased a very nice SW-60 on eBay for around $30.00. It's not the best radio for listening to shortwave or VHF/UHF, but reception of AM/FM broadcast is excellent with the SW-60, on a par with my GE Superadio III.

Hi Larry!

Well this did not work! I also try to scan between 418.0000 to 444.0000 by range of 1.0000 and i hear nothing when i hear from another scanner 411.8875.

Well i will leave that scanner in a box because it will not help me!

Thank's

Hi John!

I have a Bearcat BC8500XLT and working with the back antenna on it. I also have a discone ant. and i dont use it because i have to much reception with it and i dont have a signal attenuator on the scanner.

The discone is working find plus some model you will be able to tx. with it.

Regard's

I have a Pro-91 that works in every respect except for sound. There is no sound via either earphone or speaker. I can see that the unit scans okay since I compare with my BC245. I checked with a local RS dealer for repair estimate and was told it would be half of the 'new' price. In other words, since they are still selling for about $250, it would cost about $125 to fix.

Does that sound like standard RS policy? I don't mind paying a reasonable price to fix it, but I'm open to better options. Thanks!

They are reported to be encrypted for privacy, as was laid out in a "Behind the Scene" of the NFL a few months back.

Went into quite a bit of detail about different aspects of just communications for games....

You could try to do a search with no antenna on your scanner.. = not sure what limits to use though.

You could show up early and pick some brains...sometimes a Tech. may provide such information.

Hi, Mario:

Hmm, sorry to hear that. If the signal is strong enough, it should
work.

Hey, you can always use it to listen to us hams on 2m (144-148 Mhz)
and 440 ham bands :)

Is there nothing else in your area that you can listen to?

#1: Pro 2006 with CE232 interface kit still sealed in original box (some assembly required!). Back light never used. Original antenna and DC

converter. 2006 manual.

#2 Pro 2006 with full Opto OS 456 board (NOT the Lite version) installed.

OS 456 manual, original antenna, 2006 manual, DC converter, serial cable. I do not have any working software (the disk crapped out).

Your choice $490 plus shipping. 1st one sold goes out in an original 2006 box.

Inquire here:

mark.bryant@bms.com

And your point is??

Everybody trades frequency information back and forth. Did ScannerNut say
he had personally researched the frequencies? Not that I've seen. The
people that copy some other's list and repost it CLAIMING it as their own,
that's different. This used to happen a lot on the old BBS boards where the
operators required users to upload as well as download.

Finally, anybody that has to hide behind anonymizing software doesn't have
anything worthwhile to say anyway, so blow, Joe.

Mark (real name)

>Unless it has changed since I wrote The Phone Book:
The analog cellular system (Not PCS) has 832 channels; 416 for each
company.
They are in 21 sets (18 to 21 frequencies per set (varies) and 7
groups, A to G.
Each cell uses one group (usually 3 sets of 18 to 21) and each set has
a control channel. So, each cell has three control channels.

Cells sometimes 'borrow' frequencies from adjacent cells when traffic
is heavy and can be re-assigned on long term basis.

We marketed the DDI as Cell-Scan, used with a PRO-2006. I was a
technician there and did the assembly.

1615. FA: ENDS TODAY- Heathkit SA-2060 2KW Tuner Roller IND!

Newsgroup: rec.radio.scanner
Date: 2001-01-18 22:22:09 UTC
From: radiotek@pacbell.net
Message-ID: <3a676c80.94576290@news.nvbell.net>
Source record: 71664

I have a Heathkit Model SA-2060 Full Legal Antenna Tuner for auction.
This has a Roller Inductor, which is the best type. It tunes balanced
& unbalanced feedlines, Coax and Single Wire Antennas. It has a 4:1
Balun, Power/SWR Meter and 3 Position Coax Switch.

This works 160 Meters to 6 Meters STRAIGHT THROUGH! The built in
Power/SWR Meter can show Forward & Reflected Power Simulaneously!
This is a great tool that can show you your power while transmitting.
That way if there is a problem with the antenna, you can view the
change in power. You can also push a couple of buttons to show only
forward or reflected power.

This is the best antenna tuner that I have ever run across. I was able
to tune down to the 80m & 160m region on a 10m dipole! I can't use
this anymore due to location, so I am selling it.

The auction is ENDING around 8:00 PM Pacific Time Tonight, Jan. 18!
The price is nice..... Please visit:

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1206746596

Thank You & 73,

Mike KQ6MU

1616. PRO-26 Auto Sorting Problem

Newsgroup: rec.radio.scanner
Date: 2001-01-18 22:26:24 UTC
From: malta001@my-deja.com
Message-ID: <947qi4sc1@nnrp1.deja.com>
Source record: 71665

I've got a problem with my RS Pro-26: In Auto Sort mode (turned on) it scans all channel banks till No.5. When it reaches that 5th bank the scanning narrows only to that bank and "overlooks" all the other following (and previous) banks. All the channel storage banks are displayed - turned on (from 1-10), it starts normaly from 1-4, but when it reaches bank no.5 - it's over - it justs scans few channels within that bank (a range). When I turn off this 5th bank the scanning goes OK through all the other banks.
In "Auto Sort Off" mode everything works perfectly. Now I wonder what's the reason for this limited scanning in Auto Sort mode.
I may have pressed some other button down while turning on the scanner. I have tried almost everything to resolve this, but without success.

The channels are not locked out. I must say that I have this scanner since 1998 and it works great - except for this error that happened today.
One more thing: when I turn the "Auto Sort On", it also displays "Mon" and "Bank" on top. Is this normal?
I assume that there's a trick in pressing some additional buttons while turning on/off the scanner, but I'm rather not trying.

Any suggestion or advice will be strongly appreciated.

Hiya all! Just bought a pro-94 scanner last night and am trying to find some trunked frequencies for the Albuquerque city and Bernalillo county area. I've already got one set which sound like Albuquerque city public works and such. I'd be more interested in the city and county police bands. Been all over the internet and only find the same freq's I've already got. Also, any help with how to find trunked frequencies and such would be greatly appreciated! Not finding them like on the internet or anything, but doing the actual searching and such. Thanks!

The pro-94's instruction book is also a piece of crap. I can't figure out how to enable it to search some of the pre-programmed fleet maps. Anyone have any idea what I might be doing wrong since it's not doing what the book says it should be!

Koresh was a nut, but he had a legal and moral right to be a nut as
long as he wasn't hurting anyone. He hasn't been proven to have
committed any felonies. The local sheriff's department had never had a
problem with going up there to talk to them, the feds screwed up. They
showed up wearing black and in masks without identifying themselves.
The poor cultists probably had no idea that those were even cops and
were just defending themselves. Please keep in mind, Koresh isn't

someone I would have wanted for a friend, I DO think he was a nut, but if someone wants to think they're the new messiah it's THEIR right. It's no more off the wall than thinking there's some guy up there with a long white beard waiting for you when you die to show you your place in heaven or whatnot.

> Would I be able to receive signals 50% farther?? 100% farther??
> just a basic estimation is fine, I know it depends on lots of things.

The other responses were informative, but I think this is what you
wanted:

Let's say you could just hear a signal at 5 miles with the ducky.
My wild guess is that you might get the same signal strength at 20
miles with an attic discone.

Anything's better than a ducky.
Here's how I'd rank some antennas, in order of performance:

6- a ducky
5- 1/4 wave antenna on the scanner
4- a discone, j-pole, vertical, or whatever in the room
3- discone or whatever in the attic
2- discone or whatever on a pole outside
1- discone or whatever on an airplane

[snip]

At the local international airport gate, there is a sign that indicates a number of things you are not permitted to board with. Among the obvious (gun etc) is a symbol of a radio. Obviously you *are* allowed to board with cellphones, but they are not allowed to be used - what they are referring to is radio receivers.

Now, I understand the principle for not allowing guns on planes, and I understand the principle of not allowing cellphones to be operated while on planes, but why on earth should they restrict the use of receivers/scanners? Do they think that in the event of something going wrong, that someone listening in is >>really<< going to jump up and scream "Oh My Goodness We're All Going To Die!" I mean, come on...

Is this actually a legally mandated civil aviation/international aviation rule?

If you had read an of my posts, like the the ones in Talk.Politics.Guns on "starting the revolution", you would note that I find that type of talk foolishness. Yes, there is an element on the right that would like to believe that a revolution is the best way to solve their problems with an ever increasingly socialist government. For the most part these individuals only want to be able to live their lives in peace. They see people like you as little dictators who are always pushing the edge (so called progressives). If they could be guarenteed a life with no government interferrence then most of them would calm down.

The Left delights in frightening them. I guess that is my major bitch with Left Wingers is that they always have to push the edge. But I also have problems with those on the right who live on the edge of society as well.

And the Left has been far more willing over the last 100 years to use violence. (Do not give the crap about how right wing government as used violence, we are talking about the Left as individuals).

Buying crystals for scanners make no economic sense at all, full stop, end of sentence, that's all she wrote. Toss it in the trash and go out and get a used synthesized unit. You'll be more than glad you did and you'll spend much less money in the end.

1630. Re: How much better is a discone antenna?

Newsgroup: rec.radio.scanner
Date: 2001-01-19 01:30:40 UTC
From: Ralph Mowery <rmowery@dialpoint.net>
Message-ID: <3A6798C0.6E184E45@dialpoint.net>
Source record: 71675

Height is most important. A rough estimate can be made by taking the square root of the heigth of the duckie and adding a fudge factor of about 1.3 times that to get the distance to the radio horizon. Say the antenna is 9 feet off the ground, you then get 3 times 1.3 or 3.9 miles. If you can get it to 25 feet , you get 5 times 1.3 or 6.5 miles. Do the same to the transmitter antenna and add the distances together and you will get the distance you can hear the transmitter.

Jones wrote:

I'm sorry, what do you mean? I wasn't trolling, I thought it was a pretty genuine question: does anyone here know of any reason (other than potential passenger disturbance by a listener) for banning radio receivers on aircraft; and is this a legal restriction or is it arbitrary?

If this has in the past been the subject of heated exchange then I apologise. I did not realise.

Regards
JT

If I recall correctly...

Press menu
select trunk
select the trunk type
select the type of trunk system again and it will remove the control
channel only mode

you should also be able to select control channel only mode and back
out of it I think.

Because it jumps out of it its hard to tell that it really did remove
the control channal only mode.

CC means control channel.

NOT Control channel only mode.

if the scanner detects it as a control channel then it will display CC

Don't get confused

Actually it was a congressman and he was referring directly to the BATF tactics and methods. It was then quoted by LaPierre in an interview. Bush's handlers probably made the decision for him, feeling that the "mood" of the country favored gun control.

From: Paul Green <pgreen@concentric.net>
Message-ID: <9492i9$462@dispatch.concentric.net>
Source record: 71797

This seemed like as good a place as any to ask this question.

I have found a lot of information on how to bug or wire tap someone, but not much on the opposite--how to ensure that you are not being bugged or wire tapped. I have found some commercial sites selling various devices and equipment, but, as these sites are all trying to sell something, I am not sure what to believe.

Where can I found unbiased, reliable and (for my non-technical brain) comprehensible information on what equipment I need to ensure that someone is not being tapped or bugged?

As they say, just because you are paranoid ....

Thanks.

http://www.elecdist.com/ar5000.html

The whole site seems to be gone now. As I had read here, there had been a review of the AOR AR-5000 and some comparisons to the Icom IC-R8500.

Does anyone have a new URL and/or a copy of this document?

Mark

I'm not 100% sure, maybe someone who knows for sure can answer this or correct me, but I was under the impression that Nextel's were digital and in the cell phone range. Thus, you would be able to receive the signals, but it would sound like static or an open carrier.

> Alot of PD's in my area use Nextel phones for sensitive comm's.

1655. Mobile antenna recommendation please

Newsgroup: rec.radio.scanner

Hi All,

I'd like to get a mobile antenna for my BC 235xlt.
Looking for general freq. coverage from about 29 - 900.
I realize some antennas will be better at certain freq. ranges but I'm not really focusing on any particular range.

I have some store credit at RadShack so if they have a decent one please let me know.

Also, what mounting style would get the best results?
(LOL, I just re-read that - keep your mind out of the gutter!)

Thanks,
Dave

I have recently picked up and been using the Radio Shack magnet mount mobile scanner antenna with pretty good results. I think it's cat# 20-032.

I am running a BC 895xlt with a roof mount, (about 60ft. in the air) antenna from Radio Shack and a GRE Super amp 3001. The antenna covers (low band 30-50 Mhz, high band 148-175Mhz, UHF 450-470Mhz, UHF-T 470-512Mhz and UHF-HB 800-912Mhz). I am getting signals from about 60 to 80 miles away, but they are week. I would like to improve the 148-175mhz range and the 800-912mhz band. Is there a better antenna for longer range to cover the same bands, or a better amp?

Since no one else is stepping up to the plate on this one, I'll jump in with both feet...
Without getting into ancient history, receiving radios on commercial aircraft are banned by provisions of the FARs (Federal Air Regulations). The reasons may not be as sound today as they were in the "days of old", but briefly, because of the way a superhetrodyne radio works, all receivers are actually very low powered transmitters as well. It's necessary to generate a weak (and variable, through tuning) rf signal within the radio to beat against (hetrodyne) the desired frequency and come up with the IF frequency, which is where 'reception' really happens.

The key word is *within* the radio. Consumer grade radios are (because of part 15 requirements) much better than they used to be, but because a radio that sprayed RF while doing its receving thing would still be working fine as far as the user was concerned, the FAA (and the CAA before it) viewed these receivers as little, unpredicatble transmitters - unpredicable power, and most importantly, unpredictable frequency output.

Radio navigation in airlines/airplanes has come a long way. But much critical navigation is still done with VHF (108-118 mhz), including instrument landing systems. A changeover to GPS has not happened yet. A local oscillator output in the 108-118 mhz area is certainly within the realm of possibility... although, to be fair, these original rules came from the days when airliners were using low-frequency range navigation which I suspect would have been even more vulnerable, both because of the gererally weaker signals (and lower frequencies) and because the pilots were listening to a merging and unmerging of slow code signals for their instrunent approaches. A local oscillator back then could (and probably did) wipe out the signal for the pilot(s).

Before you ask the obvious question, let me answer it: radio equipment used in the airplane itself it subjected to rigourous tests which assure that the radio systems (actually, all electronic systems) in the airliner cannot interfere with critical systems function, such as the instrument landing system. Your new consumer grade radio, while probably not standing a chance of interfering, has not been tested in that manner, and that is the reason for the continuing ban.
